

DocProd Checklist

Add a New Form to DocProd

OVERVIEW

Products will provide WORD docs for the new forms to be added to DocProd. They are usually forms with new edition dates for existing forms in the DocProd system.

We must convert the WORD doc into FAP format and implement it into DocProd.

This checklist will provide a step by step process guideline.

TASK 1 – Convert the WORD doc into FAP format

Task	NOTES	
Receive the WORD doc from Products		
Receive PDF doc from Products		
Print the WORD doc		
Update the Master Form spreadsheet	I have a local version that I manually sync up periodically with the network version Multiple users will have to develop their own process for managing this spreadsheet.	
Insert a new line for a new form OR	Assign a FAP name to the new form. Typically, use the form name + "A". Ex: AA1234A	
Duplicate the existing form line and increment the version letter	Assign a FAP name to the new edition date of the form. Typically, use the form name + "incremented version Letter". Ex: AA1234B Also, some of the CSC base system forms did not use the full form name. Ex: A1234A.DAP instead of CA1234A.FAP. Take this opportunity to switch from a single letter to the full form name.	
All the columns in the spreadsheet should be filled in using data from Products, ALR and DocProd.		
Do a quick search to ensure that the name you chose does not currently exist in DocProd.	If so, adjust accordingly.	
Open the word doc and save as "RTF" format.	"Save As" using the new FAP name determined from the previous step. Ex. CA1234A.RTF	

Copy the RTF file to the MSTRRES\MOECO\FORMS folder		
Start the Image Editor, open the RTF file "Save As" FAP type Close the image. Remove the RTF file from the folder	Save DDT? - yes	
Update Network Master Form spreadsheet S	Enter into Network Master Form spreadsheet	

TASK 2 – Adjust the new FAP image so that it is exactly like (or closest to) the WORD doc from products.

The RTF conversion is about 85%, you have to do the remaining cleanup.

Task	NOTES	
Using the TEMPLATE, adjust the parts of the form to match the WORD doc/PDF	You may have to split text boxes to reveal the individual lines	
Add header items to first page		
Add all other items to the first page	Some forms have schedules, lines and boxes The lines / boxes may be on other pages...remove them and recreate on the first page.	
Fix pagination for page 2 and beyond	Make sure the text boxes / columns begin and end with the proper words / sentences, etc	
Add footer items on all pages		
Remove any blank pages	Sometimes blank pages are created when text boxes are edited	
Add fields, if any	Adhere to current formats. Field lengths	
Field Mapping	Look at previous version of the form Overflow	
Create PDF version from DocProd	Use the utility	
Desk Check PDF Compare	Compare PDFs from DocProd vs from Products. Resolve differences. You can use BC. NOTE: The PDF's will not match exactly on word and line position...only check for words, pagination and line breaks.	
Send PDF Proof Copy to Kraig		

TASK 3 – Implement the new Form into LOCAL DocProd

Validate that FAP and DDT files exist in the proper folders	If you created a PDF in the above section, then the objects are in the proper folder.	
Add new form to FORM.DAT	Add the form to all LOBs that apply If the form is a new edition data, simply add a line after the current version. If a new form, make sure it is in the proper section.	
Add new form to SETRCPTB.DAT	Add the form to all LOBs that apply If the form is a new edition data, simply add a line after the current version. If a new form, make sure it is in the proper section. Is the new form state specific with a counting parm for overflow? If so, maybe the all states version of the form needs to exclude the new state? Examine on a case by case basis	
Any Changes to existing form's field mapping?	ie. A new state version of a form. Need to split up the data that goes on this form vs the old "all states" version, therefore change the current forms mapping, Examine on a case by case basis.	

TASK 4 – Unit Test

Find/edit an EXTRFILE.DAT to cover all possible scenarios for data and overflow conditions	Edit a form record (ASBE) to make the new form generate Utility = Extract Viewer	
Run GENTRAN, GENDATA, GENPRINT (PCL and PDF)	Look at output files to validate	
POLFILE.DAT	Open the file and validate that the new form is there. A utility is available to make this file more readable	
PCL file	Using Swiftview, open and view the new form	
PDF file	Open the output file and view the new form	
If variable fields on the form, validate the data	Validate the correct data and placement on the page. May have to print to validate some attributes, etc	
Move to DocProd SandBox for ALR unit test		

Create an Inventory list along the way.
