

From Kim Gibson

Karen - I have been able to identify the following pre-release fixes for EZ Data Capture. These are available to be pulled as pre-release, and I think all of them seem likely to have something to do with the problems as you are describing them... After reviewing, please let me know if MoE would like an effort to retrofit these fixes into C.O.42.

156733:

1. When you select Forms List on your policy and the panel display you should be allow to Delete or Change the Form information. The change function does not display the form information, so you can not change any of the information. The same in both Classic and J.

If you delete the form your policy, you just entered and would like to reenter it.. You can not. The system will allow you to delete the form. but when you submit it again, the same information comes up and an error message displays that the record already exist.

If a Manual Form is added to the policy, the "More Data" field displays as 'N' (instead of 'Y') not allowing user to enter the information on the form.

142268:

When an EZ Data Capture (EZDC) form has multiple Sequence Numbers and there are multiple occurrences or iterations of the form, regardless of whether any iteration/occurrence has been deleted, the corresponding BASPEZCAP records in EXTRFILE have incorrect Form Line Numbers (a/k/a iteration number or occurrence number). For example, suppose an EZDC form has so many fields that it requires two BASPEZCAP records to contain them all. If the form were added to a unit twice, there would be four records in the BASPEZCAP file. Two of those records would exist for the first iteration of the form. They would have Form Line Number 0, but one would have Sequence Number 1 and the other Sequence Number 2. The other two BASPEZCAP records would exist for the second iteration of the form. They would have Form Line Number 1, but one would have Sequence Number 1 and the other Sequence Number 2. In EXTRFILE, there would also be four BASPEZCAP records. Two would be correct, with one having Form Line Number 0 and Sequence Number 1, and the other having Form Line Number 1 and Sequence Number 1. However, the other two BASPEZCAP records in EXTRFILE would be incorrect. Although they would each have the correct Sequence Number, 2, one would have Form Line Number 2, which should be 0, and the other would have Form Line Number 3, which should be 1.

The Form Line Number resequencing logic in program FORMCBLPGM, implemented under FSIT 116316, cannot work properly when a form has more than one Sequence Number and iteration, because the wrong input file is being used to build the TEMPEZCP file in program BASEZEXTRC. TEMPEZCP is used by FORMCBLPGM to build the BASPEZCAP records for EXTRFILE. Program BASEZEXTRC should use the BASLEZCAP2 logical file, which is sorted by Form Line Number then Sequence Number, as input. However, it is using the BASPEZCAP physical file, which is sorted by Sequence Number then Form Line Number.

136759:

Since the field size for Insurance Line is incorrect in the copybook when a policy with a 3 character insurance line like BOP that contains EzData forms is endorsed and the form data is modified the forms are not printing on endorsement because the key does not match.

Need to modify the copybook and recompile the 2 programs that use it FORMCBLPGM and BASEZCPM05
