## Chapter 1

# Introduction

This manual serves as a reference for Documaker Workstation. It contains information related to creating and maintaining customer documents such as loan applications, statements, policies, or corporate correspondence.

The system optimizes and maximizes forms processing procedures by letting you produce, print, store, and archive forms electronically. You no longer struggle with mountains of paper, lost forms, or lack of storage space.

This manual discusses all of the features you can use as you work with electronic forms. To help you get started, the last chapter of this guide contains a brief tutorial illustrating the creation of an insurance policy and policy renewal. We recommend you go through the tutorial to familiarize yourself with the system and its capabilities.

This chapter discusses...

- [Overview on page 2](#)
- [System Directory Structure on page 5](#)

## OVERVIEW

Documaker Workstation is the workstation-based form set entry and publishing piece of the Documaker system. Documaker is a total form set automation system which enables forms-intensive industries such as insurance, finance, utilities, and government to automate enterprise-wide forms and forms processing.

You collect the information you need for your form sets from various sources including manually entered data, system default data, archived data, and data extracted from external application systems. Documaker Workstation lets you enter that information and print complete, collated form sets on laser printers.

The system's unique data import and export feature enhances the data entry process. The system lets you import data files that automatically fill or propagate the data onto a form's fields. Exporting lets you extract data from Documaker Workstation for use in other applications or for import back into the system.

The system's user interface makes data entry and forms processing easy for non-technical users. You enter basic information and Documaker Workstation displays a list of applicable forms. You then select specific form sets in which to enter data.

This illustration shows the process:

The system lets you import data from an external or an internal source and apply the data to specific forms. You can also export data to use in other application systems or to import back into the system.

## FEATURES AND BENEFITS

Documaker Workstation includes many features. Depending on your company's license, you may receive some or all of the following features:

### Data entry features

The entry features include these features and benefits.

- On-screen Data Entry - You can select specific forms in which to enter data, then enter the data on-line. The system stores images (forms) and data separately, then merges them during the print function. This data collection method reduces errors, eliminates repetitive data entry, and increases productivity.
- Resource Libraries - Each company for which you process forms provides a resource library containing form images, form set definitions, and control settings that define how you enter and process variable data. Using resource libraries affords flexibility among the resources without affecting the integrity of form, data, and library file organization and structure.
- Data Propagation - Data propagation makes it more efficient to enter data. The system automatically applies the same data to like fields containing the same field name. For example, assume you enter data into five different forms, all of which require a number such as an account or policy number. Once you enter this number on the first form, the system searches the remaining forms for the same variable field, and places the number in those fields. This feature eliminates repetitive data entry and reduces data entry errors.
- Data Importing and Exporting - The system offers data import and export options. You can import data from an external application source, or from a system export file, and the system automatically prefills the appropriate fields on the forms with the imported data. You can also export data to use in other applications or to import back into the system.

### Work-in-process features

Work-in-Process (WIP) features automate various aspects of data storage and information sharing. Placing form sets and documents in WIP increases processing efficiency and reduces the costs associated with paper documents.

Begin entering information  
onto the form set

Store the incomplete form  
set in WIP

Finish entering information  
and complete the form set

Assign the form set to the  
appropriate recipients

---

**NOTE** Your system supervisor can customize certain WIP features specifically for your company.

---

The WIP features provide these benefits:

- **Fast and Easy Temporary Storage** - WIP serves as a document holding area when you need a temporary storage area for data. You use this temporary storage area for a variety of reasons: to efficiently share information, to effectively link various applications, and to hold a document while you seek additional information necessary for its completion. Form sets and documents remain in WIP until manually retrieved by an operator or automatically retrieved during data merging.
- **Assignment Capabilities** - WIP provides rapid and efficient sharing of information between users. You can assign and route information in the manner most suitable for your unique departmental and enterprise needs. Electronic information sharing facilitates quick and efficient procedures for document approval within your business. This routing capability extends across Local Area Networks (LANs) and Wide Area Networks (WANs).

- **Efficient Use of Time** - WIP features make sure your time and personnel are used efficiently. An operator frequently needs information which is not immediately available to complete a form set or document. WIP allows an operator to complete as much of a document as possible, safely store the completed portion, and continue with other activities. When the information becomes available, WIP provides instant document retrieval for completion of the work.
- **Efficient Use of Resources** - WIP features help you use your business resources efficiently. Many companies merge data from other applications into form sets and documents. WIP ensures a smooth and efficient interface between various applications. Missing data and merge errors result in inefficient processing. Printing a flawed document wastes paper and print time and requires unnecessary sorting and reprinting. Printing an error also means the mistake may be undetected and repeated on subsequent documents. WIP eliminates these problems. Errors are identified and corrected prior to printing.

### Print features

The system offers a variety of print options which let you print documents at any stage of completion. You can print document copies to check your work, and you can print archived documents for reference. You can also print documents to a file.

- **Multi-Platform Operability** - The print features integrate into your current system, which means you do not have to purchase new or proprietary equipment to print your form sets. These features work with both PC and mainframe computers and with single user workstations and networked systems.
- **Data Merging** - The system stores forms and data separately. The system merges data with the appropriate form or document when you print it. This technique saves space and time when routing, archiving, or printing documents because you store images only once, not each time you work with the image.
- **Downloading Fonts** - Your forms and documents may contain fonts not resident in your printer. The system lets you download fonts from your documents or from a spool file to your printer. If you use a spool file, you download fonts only once—the first time you print documents containing those fonts. There is no need to repeat the downloading process each time you print a form. You can, however, download fonts specific to a single form and then immediately print that form.
- **Supports Downloading Forms** - In addition to downloading fonts, you can configure your system to download forms or images to your printer during a system initiated batch print. This option is especially useful when you print large volumes of documents. Your system automatically downloads the form or image once, saving valuable processing time.
- **Batch Queues** - When you manually enter data into forms, you can send the form set to a print batch queue, a temporary print storage area. The queued form sets print in their batch order. At a later time, you can go to the print batch queue and print all form sets or selected form sets within the batch. The system organizes queued form sets by user ID. As a security feature, you cannot access or print another user's form set unless you are an authorized user (manager or supervisor) of the form set.

## SYSTEMDIRECTOR\$STRUCTURE

The system's directory structure lends itself to customizing many of the subdirectories and files. Because the system lets you use external resources such as forms, your system supervisor can modify certain files to tailor menus, form set organization, and printing, and archiving functions.

The example below illustrates the system's directory and subdirectory structure:

See the [Documaker Workstation Supervisor Guide](#) for more information about configuring files and the system's directory structure.

## Chapter 2

# Getting Started

This chapter contains information to get you started with the system. For information about installing the system, see your system supervisor.

- This chapter discusses...
- [Starting the System on page 8](#)
- [System Task Flow on page 9](#)
- [Working in the System on page 10](#)
- [Customizing the Views on page 12](#)
- [Using the Toolbar on page 19](#)
- [Using Menus and Shortcuts on page 20](#)
- [Working with Resource Libraries on page 24](#)

## STARTING THE SYSTEM

Typically, your system supervisor installs the system and sets up icons you can use to start the system. If you process information for multiple companies—a common scenario in the insurance industry—your system may display an icon for each company.

---

**NOTE** See the Documaker Workstation Supervisor Guide for specific information about creating icons or resetting locked IDs.

---

To start the system, you simply double-click the system icon.

## LOGGING ON

Depending on your system configuration, you may be required to log on using your ID and password to access the system. Generally, when you log on to the system, your user ID and password are the same. If you do not know your ID and password, check with your system supervisor.

To log on to the system, double-click the system icon. The system displays the Logon window.

Type your user ID in the User ID field; then, press **Tab**.

Type your password in the Password field. The system displays asterisks (\*\*\*) instead of the password characters. Press **ENTER** or click **Ok**, to start the system.

## EXITING THE SYSTEM

To exit the system, first close any form sets you have open, saving your work if necessary, then use the File, Exit option to exit the system.

## SYSTEMTASK FLOW

From the system's main window, you choose File, New and select the key field information, such as selecting a company and corresponding lines of business, for a particular form set. The system displays the list of forms applicable for that key field data.

You can then change the number of recipient copies in the forms list. Next, you enter the required variable data into each form. If multiple forms require the same field data, the system automatically propagates the data into subsequent forms.

You can print a form set once you complete data entry, or send a form set to a batch queue for printing later. When you print form sets, the system merges the data with the appropriate form *template* and prints the form set. The system then archives the data and the form set template separately.

With Documaker Workstation, you can automate the forms processing functions for all companies for which you write business and for all lines of business.

## WORKING IN THE SYSTEM

The two main types of windows you use in the system are *entry* and *list* windows. It is important that you become familiar with the general window layout so you can work quickly and efficiently.

**NOTE** Your system can be customized in many ways, such as by changing the titles of windows and by adding or removing options. This manual is based on the standard system, without customizations.

### Using the Entry Window

You perform most forms processing tasks using the Entry window. You use the Entry window when you enter data, retrieve form sets, and when you submit print jobs.

You enter data directly onto the form and then press Tab to move to the next entry field.

You can also use the Data Entry field (shown below) to enter data.

If you select the Options, Field Information option, the system displays information about what you should enter into the field here.

This includes the number assigned to the entry field, the field type, such as numeric or alphabetic, and the field prompt.

If you select the Options, Fixed Edits option, the system displays the Data Entry field, as shown here.

You enter information here then press Tab to move the information to the form and go to the next field.

If you turn on the Options, Fixed Prompt option, the system also displays the field's prompt above the data entry field.

The field is highlighted for reference.

## Using List Windows

List windows display all the forms or form sets that are available for processing. From a list window, you select a form or form set on which to perform an activity.

The system shows you information about the various forms sets.

You can double-click on these column headings to search for a specific form set.

Click on a form set to select it and then click Ok

OK Refresh Cancel Help

There are several varieties of list windows in the system. Some list windows let you select forms to include during form set processing, while others list the form sets available for retrieving or sending to archive. List windows and the Entry window contain many of the same components.

## CUSTOMIZING THE VIEWS

Whenever you open a form or form set, the forms appear in the Entry window.

In the Entry window you can customize your window view. If you selected multiple forms to view, the Entry window displays the forms simultaneously on the window.

You can adjust how you view each form, by stacking, cascading, or tiling the forms. The system defaults to stacking forms on top of one another. You can also customize each image view within a form. The Entry window contains these menus you can use to customize the view:

- View. Options that control the size of the window display and which form or image is displayed.
- Formset. Options that control the duplication of forms, the display of forms by recipients, and let you close form sets.
- Options. Options that control the display of additional elements within the form or image.
- Window. Options that control how the form set appears on the window, such as stacked, cascaded, or tiled.

## DISPLAYING FORM SETS

A form set is made up of all forms and copies of forms associated with a single transaction, such as an insurance policy or a loan application.

Form sets  
consist of one  
or more forms

Form display options let you control the display of a form and the images that comprise it. A single form consists of one or more images (pages). Since you have multiple forms and images within a form set, you can view and navigate through each form and image individually. When you display forms, the first image of each form displays as ordered in the Available Forms list on the Forms Selection window.

Forms consist of one or more images

Page (image) display options let you manipulate the display of the images attached to a form. For filing and display purposes, each image is a separate page or image display. A form may consist of multiple images, and consequently you can view the varying images within a form by displaying different pages of the form.

An image can contain varying sections on one page. For example, an automobile insurance application form could consist of three images. The first image or page may contain three separate sections: a section for listing the automobiles you want to insure, a section for recording household driver information, and a section for selecting the type and amount of coverage you want for each vehicle. Using the page display options, you can zero in on and view the beginning of a particular section of the insurance application image.

Images consist of one or more sections

## USING THE VIEW MENU

View menu options let you change the display size, display and navigate through specific forms and images, and refresh the window to reflect changes made during entry.

When you select View, this menu appears:

The following table contains a brief summary of each View option.

Choose... To...

|               |                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fit to Width  | Display the full width of the image in the active window. The entry window displays the complete horizontal width of the first image of your selected form.                                                                                                                                                                                                          |
| Fit to Window | Display the entire image in the active window. You see your full image on one window.                                                                                                                                                                                                                                                                                |
| Zoom          | Magnify or reduce the size of the image display. You can use the preset Zoom scale, define your own scale, or use the slide bar to adjust the Zoom factor. Click  in the Zoom window to return to the entry window. The image display will reflect the change in the Zoom factor. |
| Zoom In       | Increase the magnification of your form display. The image will continue to increase in magnification each time you select the Zoom In option.                                                                                                                                                                                                                       |
| Zoom Out      | Decrease the magnification of your form display. The image will continue to decrease in magnification each time you select the Zoom Out option.                                                                                                                                                                                                                      |
| Zoom Normal   | Return your form to 100% display size.                                                                                                                                                                                                                                                                                                                               |

Choose... To...

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Form    | Display a specific form or to scroll through forms in the form set. On the Form menu, choose Select Form to display the Select Form window. Select the form you want to view and click  . The system displays the first image of the form you selected. Choose Previous, from the Form menu to scroll backward through the forms in the form set. Choose Next to scroll forward through the forms in the form set. The system displays either the first page of the previous form or the first page of the next form, depending on your selection. If there are no previous or subsequent forms to display, the last form you displayed remains on the window.                                                                                          |
| Page    | Display a specific image section or to scroll through the pages in the form set. On the Page menu, choose Select Section to display the Select Section window. Select the image section you want to view and click  . The system places your cursor in the first variable data field of the section you chose. If the Select Section window is blank, there are no image sections set up. Choose Previous, from the Page menu to scroll backward through the pages in the form. Choose Next to scroll forward through the pages in the form. The system displays either the previous or next page of the form, depending on your selection. If there are no previous or subsequent pages to display, the last page you displayed remains on the window. |
| Refresh | Redisplay your form after making changes in the window. Refresh repaints the window to reflect your changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## USING THE FORMSET MENU

Formset menu options let you select the forms you view by recipient, duplicate a form for entry, assign a form set to another user, or close the form set.

When you select Formset, this menu appears:

The screenshot shows the 'Processing System' window with the 'Formset' menu open. The menu options are: Close, Select Recipients..., Assign Document, and Duplicate Form. The background form is titled 'COMMERCIAL LINES POLICY COMMON POLICY DECLARATIONS' and is for 'FormMaker Insurance Company'. The form includes the following information:

- Named Insured and Mailing Address:** Charlie Dunn, 123 Walker Ave, Austin, TX
- Policy No.:** 985456790
- Policy Period:** From 3/1/99 to 3/1/00 at 12:01 A.M. Standard Time at your mailing address shown above.
- Business Description:** boot maker
- THIS POLICY CONSISTS OF THE FOLLOWING PARTS:**

|                                            | PREMIUM |
|--------------------------------------------|---------|
| Commercial Property Coverage Part          | \$      |
| Commercial General Liability Coverage Part | \$      |
| Commercial Crime Coverage Part             | \$      |

At the bottom of the form, there are three fields: '1) Alphanumeric', 'RENEWAL NBR', and 'RENEWAL NBR'.

A brief summary of each Formset option appears below:

| Choose...         | To...                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Close             | Close the form set. The system displays a message asking if you want to save the entered data. Click Yes to save the data to WIP or No to exit Entry without saving your changes. The system can be configured to suppress the Confirm Save message and automatically save entered data to WIP. See your system supervisor for more information on this INI option.                                                                                                            |
| Select Recipients | Display only a specific recipient's forms. When you choose this option, the Select Recipients window appears. Click the recipient whose forms you want to view, then click OK to return to the Entry window. Only that recipient's forms appear. Supervisors can customize the Formset Menu to let users choose a recipient view directly from the menu. See <a href="#">Customizing the Formset Menu on page 16</a> for more information on this feature.                     |
| Assign Document   | Assign a form set to another user. For instance, you can assign a document to another user for approval or to have the other user finish completing the form set.                                                                                                                                                                                                                                                                                                              |
| Duplicate Form    | Duplicate a form. Before choosing this option, be sure the form you want to duplicate is selected in the Entry window. When you select this option, entry displays the duplicated form in the window with policy data and recipient copy information automatically propagated to the appropriate fields. Proceed with entering data. The system displays a message telling you that a form is not repeatable if it has not been designated as repeatable in the FORM.DAT file. |

## Customizing the Formset Menu

If you need to view a certain recipient's forms repeatedly, your supervisor can customize the Formset menu to replace the Select Recipients option with the recipient's name on the Formset menu. Multiple recipients (such as the INSURED recipient and the AGENT) can be placed on one menu option and more than one option may be added. Additionally, your supervisor can add a View Next Recipient option to the Formset menu which lets you switch to the next recipient's form view.

## USING THE OPTIONS MENU

The display options on the Options menu let you show additional display elements on the window to enhance the window view, or they provide you with more information about the view. These options are toggle switches, or on/off options.

On/off options display a check mark ( ) when an option is *on* or *selected*. No check mark appears when an option is *off* or *deselected*.

When you select Options, this menu appears:

This illustration shows the screen with the Fixed Prompt and the Fixed Edits options turned on.

The Xs indicate the location of the variable fields. Use the Field Template option to turn on or off the display of Xs.

A brief summary of each option appears below:

| Choose...      | To...                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field Template | Show the location of variable fields using Xs to indicate where you enter data. Each X represents a single character, which indicates the number of characters you can enter. Keep in mind that if there is data entered in the field, the data appears as a string of Xs. |
| Auto Focus     | Have the system automatically shift focus to the next variable field when you press TAB in a field. With Auto Focus, you do not have to scroll through an image to display a particular variable field that extends beyond the initial display area.                       |
| Information    | Display the field number and field type when you place your cursor in a variable field. The information appears at the bottom of the window.                                                                                                                               |
| Fixed Edits    | Display a data entry field at the top of the screen (as shown above). You enter and edit data here. The system moves your entry to the highlighted variable field when you press TAB.                                                                                      |
| Fixed Prompt   | Add a prompt for the current data entry field above the entry area, if you turned on the Fixed Edits option.                                                                                                                                                               |

## USING THE WINDOW MENU

Window menu options let you choose how forms or images appear. When you select Window, this menu appears:

This illustration shows the screen with the Tile option selected.

Click on the title bar to select the form you want to work with. The system places the cursor in the first variable field.

You can also use these toolbar buttons to quickly switch between cascade, tile, or stack.

Click the maximize button to expand the form window to full screen.

This table describes the Window menu options, which you use to display multiple forms or images. Try the various options to see which best fits the way you work.

#### Choose... To display multiple form or image windows...

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cascade    | In a layered fashion. The forms cascade one behind another so you can see and select the title bars of every form in the form set.                                                                                                                                                                                                                                                                                                                                                              |
| Tile       | Each in a separate scrollable box on the window. If you tile a form set, each box displays the first image of each form within that form set. The more forms the form set contains, the smaller the tiles display on the window.                                                                                                                                                                                                                                                                |
| Stack      | Stacked on top of one another. You close each top layer display window to reveal underlying windows.                                                                                                                                                                                                                                                                                                                                                                                            |
| Stack Only | Stacked on top of one another. Stack Only is the default display used when you retrieve archived forms. This option only applies to archived forms display. By displaying archived forms in Stack Only mode, you spend less time retrieving, and use fewer system resources. You can click the Stack Only option to deselect it after you retrieve the archived forms. For more information about retrieving archived forms, see <a href="#">Archiving and Retrieving Form Sets on page 131</a> |

**NOTE** To display the first form in the form set, press **ALT+HOME**. To display the last form in the form set, press **ALT+END**.

## USING THE TOOLBAR

The system toolbar appears directly below the menu bar and gives you quick access to the most commonly performed processing tasks. In addition, the toolbar provides an easy method for scrolling through forms and form sets and for customizing the view.

The toolbar icons and their corresponding options appear below:

New Formset

Edit Formset

Save Formset

Print Formset

Send WIP

Receive WIP

Previous Form

Help Contents

Table - This option is only active during data entry if the image creator attached a table file to the variable field.

Help - This option is only active during data entry if the image creator attached a help file to the variable field.

## USING MENUS AND SHORTCUTS

System menu options are explained within tasks throughout this manual. The following tables contain keyboard shortcuts for each menu in the system.

### File menu option shortcuts

| To Choose:    | Press:   |
|---------------|----------|
| New           | ALT+F, N |
| Edit          | ALT+F, E |
| Save          | ALT+F, S |
| Complete      | ALT+F, C |
| Print         | ALT+F, P |
| Library Setup | ALT+F, L |
| Exit          | ALT+F, X |

### WIP menu option shortcuts

| To Choose: | Press:   |
|------------|----------|
| WIP List   | ALT+I, W |
| Save       | ALT+I, S |
| Receive    | ALT+I, R |

### Retrieve menu option shortcuts

| To Choose: | Press:   |
|------------|----------|
| Formset    | ALT+R, F |

### View menu option shortcuts

| To Choose:    | Press:   |
|---------------|----------|
| Fit to Width  | ALT+V, F |
| Fit to Window | ALT+V, W |
| Zoom          | ALT+V, Z |
| Zoom In       | ALT+V, I |
| Zoom Out      | ALT+V, O |
| Zoom Normal   | ALT+V, N |

|                |             |
|----------------|-------------|
| Form           | ALT+V, M    |
| Previous       | ALT+V, M, P |
| Next           | ALT+V, M, N |
| Select Form    | ALT+V, M, S |
| Page           | ALT+V, P    |
| Previous       | ALT+V, P, P |
| Next           | ALT+V, P, N |
| Select Section | ALT+V, P, S |
| Refresh        | ALT+V, R    |

#### Formset menu option shortcuts

| To Choose:        | Press:   |
|-------------------|----------|
| Close             | ALT+S, C |
| Select Recipients | ALT+S, R |
| Assign Document   | ALT+S, A |
| Duplicate Form    | ALT+S, D |

#### Tools menu option shortcuts

These options are discussed in the supervisor guide and are unavailable to users without sufficient access rights.

| To Choose:             | Press:      |
|------------------------|-------------|
| User ID Maintenance    | ALT+T, U    |
| Routing Slips          | ALT+T, R    |
| Print Log File         | ALT+T, L    |
| DBF Maintenance        | ALT+T, D    |
| Pack Database          | ALT+T, D, P |
| Delete Log Records     | ALT+T, D, D |
| Delete WIP Records     | ALT+T, D, D |
| Batch Import From File | ALT+T, B    |

#### Options menu option shortcuts

| To Choose:     | Press:   |
|----------------|----------|
| Field template | ALT+O, F |
| Auto Focus     | ALT+O, A |
| Information    | ALT+O, I |

Window menu option  
shortcuts

|              |          |
|--------------|----------|
| Fixed Edits  | ALT+O, E |
| Fixed Prompt | ALT+O, P |

Help menu option  
shortcuts

| To Choose: | Press:   |
|------------|----------|
| Cascade    | ALT+W, C |
| Tile       | ALT+W, T |
| Stack      | ALT+W, S |
| Stack Only | ALT+W, O |

| To Choose:          | Press:   |
|---------------------|----------|
| Contents            | ALT+H, C |
| How to              | ALT+H, H |
| Shortcuts           | ALT+H, S |
| Glossary            | ALT+H, G |
| Using Help          | ALT+H, U |
| Product information | ALT+H, P |

Option Button shortcuts

There are windows throughout the system which contain option buttons. You can use these keyboard shortcuts instead of clicking on the button:

Ok -ALT+O  
Sort -ALT+S  
Refresh -F5

Entry window shortcuts

When you enter data, you can move around the forms using keyboard shortcuts. Here are lists of the shortcuts available in the Entry window.

| To:                              | Press: |
|----------------------------------|--------|
| Copy data in a variable field    | CTRL+C |
| Cut data from a variable field   | CTRL+X |
| Paste data into a variable field | CTRL+V |

| To Go To:                             | Press:    |
|---------------------------------------|-----------|
| First form within the form set        | ALT+HOME  |
| Last form within the form set         | ALT+END   |
| First field within the displayed form | CTRL+HOME |
| Last field within the displayed form  | CTRL+END  |

## WORKING WITH RESOURCE LIBRARIES

The system uses forms, fonts, and logos (graphics) to create the form sets you see on your screen. These *resources* are stored in resource libraries. Typically, you have a resource library for each family of forms you work with.

Setting up and configuring your resource libraries lets you organize your files within specific directories, designate directory changes, and add or remove resource libraries. The File, Library Setup option is the file manager for your system resources.

This topic discusses the following tasks you can perform to organize system resources:

- [Setting up a Library on page 24](#)
- [Selecting a Library on page 24](#)
- [Modifying Library Information on page 25](#)
- [Deleting a Library on page 28](#)
- [Control Path Error Checking on page 29](#)
- [Using System Supervisor Tools on page 30](#)

## SETTING UP A LIBRARY

The Library Setup option lets you customize the configuration file settings in your current master resource library. When you set up a resource library, you create links between the system and its resources. You must copy the resource files to the library directories. You can do this either before or after you set up or change your master resource library.

When you add or remove a library, or change the directory paths and file settings within a library, you update the links to the resources. Depending on the number of forms you work with, you may want to split your resource library into subdirectories so you can more quickly find the forms you need using the Setup Master Resource Library option. This option is only available when all transactions are closed.

---

**NOTE** Access to this menu option depends on your user security level, as defined by your company. Only users with system supervisor or a similar access level can set up resource libraries. Consult with your system supervisor to determine the most efficient way to group the resources you use.

---

## SELECTING A LIBRARY

Selecting a master resource library lets you choose the resources you want to use. When you select a resource library, you tell the system to use the resources in that library. The default master resource library is the SAMPCO library included with the system.

---

**NOTE** Access to this menu option depends on your password level. See your system supervisor for more information.

---

To select a resource library, choose File, Library Setup. The Setup Master Resource Libraries window appears.

Click the library you want to work with; then, click Ok. You can now work with the resources in that library.

## MODIFYING LIBRARY INFORMATION

Using the Library Setup options you can add a customized resource library or change the existing library path and file settings.

To add or change a library, follow these steps:

- 1 Choose File, Library Setup to open the Setup Master Resource Libraries window.

- 2 Choose one of these options:

To...

Do this...

Create a new library Click Add

Change a library Click the library you want to change; then click Change.

The system displays the Resource Library window. Make sure the directories correspond with your selected library. If not, repeat the task of selecting a library. If you had previously chosen Add, the directories may be different than what you need.

**NOTE** If you click Reset after you change or add library files and subdirectories, your settings revert to their prior status and you lose all changes. This is also true if you click Cancel.

The Resource Library window contains these fields and related information:

| Field    | Description                                                                                                                                                                                    |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Library  | Name of the library                                                                                                                                                                            |
| ARCPATH  | Directory path of the archived files                                                                                                                                                           |
| CARPATH  | Directory path of the compressed archived files                                                                                                                                                |
| COMPLIB  | Directory path of compressed resource files                                                                                                                                                    |
| DEFLIB   | Directory path of the library fonts, font definition files (FXR), and form definition files (FORMDEF). Depending on system customizations, your fonts may be located in the FontLib directory. |
| FNTFILE  | Name of the downloadable font spool file                                                                                                                                                       |
| FONTLIB  | Directory path of the specific font set. Depending on your system customization, your fonts may be located in the DefLib directory.                                                            |
| FORMDEF  | Name of the FORM.DAT (form set definition table) file                                                                                                                                          |
| FORMFILE | Name of the Library file (.LBY)                                                                                                                                                                |
| FORMLIB  | Directory path of the library forms                                                                                                                                                            |
| HELPLIB  | Directory path of the form related help information                                                                                                                                            |
| LBYLIB   | Directory path of the library files (*.LBY)                                                                                                                                                    |
| LOGOFILE | Name of the logo library file (*.LBY)                                                                                                                                                          |

| Field    | Description                                          |
|----------|------------------------------------------------------|
| TableLib | Directory path of the form related table information |
| WIPPath  | Directory path of the work-in-process files          |
| XrffFile | Name of the font cross-reference file                |

- 3 Type the name of your new library, or change the library name in the Library field if necessary.

**NOTE** If you know the various directories and file names you want to change, you can click the applicable field and type the new path or file name. If you rename files or directories on this window, you must also rename the files in your operating system.

- 4 Click the library path or file you want to add or change; then, click Browse. The system displays either the Select Directory window or the Select File window, depending on your field selection.
- 5 To add or change directory information, see [Modifying Directory Information on page 27](#). If you are adding or changing file information, see [Modifying File Information on page 28](#).

## Modifying Directory Information

Follow these steps to add or change directory information:

- 1 Select the drive where the system stores the files you want to use or change.

Double-click these dots to go back to the parent directory

- 2 Double-click the dots in the window to display the previous subdirectory within the current directory path. Each double-click moves you one step back in the directory hierarchy.
- 3 Click the appropriate directory in the list; then, click Ok to accept your changes to the directory path. The system returns you to the Resource Library window.

---

**NOTE** If you need to change your most recent unsaved settings to their prior status, click Reset in any Resource Library window. The Reset button lets you quickly revert your changes on a particular window to their prior settings.

---

- 4 Click Ok in the Resource Library window to file your Master Resource Library changes. The system returns you to the Setup Master Resource Libraries window.
- 5 Click Ok in the Setup Master Resource Libraries window to save your additions or changes.

## Modifying File Information

Follow these steps to add or change file information:

- 1 Select the drive where the system stores the files you want to use or change.

- 2 Select a new directory in the Folders field if you want to store your master resource library in a different directory.
- 3 Enter the name of the file you want to include in your master resource library in the File Name field or select it from the File list.
- 4 Click Ok to make additions or changes to your master resource library. The system returns you to the Resource Library window.
- 5 When you complete making changes or additions to your master resource library files, click Ok in the Resource Library window. The system returns you to the Setup Master Resource Libraries window.
- 6 Click Ok to save your changes and close the Setup Master Resource Libraries window.

## DELETING A LIBRARY

The Delete option lets you delete a resource library from your list of available libraries. By deleting a library, you do not delete the library resources from the system; you merely remove those grouped resources from the option list.

- 1 To delete a library, choose File, Library Setup. The system displays the Setup Master Resource Libraries window.

- 2 Click the resource library you want to delete; then, click Delete. A confirmation window appears.
- 3 Click Yes to delete the resource library or No to cancel. The system returns you to the Setup Master Resource Libraries window.
- 4 Click the resource library you want to continue working with; then, click Ok. You can no longer use the resource library you removed.

**NOTE** If you need to add a library that's been deleted from your available libraries list, see [Modifying Library Information on page 25](#)

## CONTROL PATH ERROR CHECKING

This option tells the system to recognize new paths during master resource setup, or to alert you if you define a path which does not exist. The system displays an error message with an option to discontinue the message display.

Click Ok to continue displaying the error message when you add an undefined path to your master resource library. Click the check box; then, click Ok to disable the message and close the window. The system lets you define new paths during library setup without displaying the message.

You can make the directories for the new paths after you have set up the master resource library.

**NOTE** The error window becomes active again after you exit the Resource Library window.

## USING SYSTEM SUPERVISOR TOOLS

In the system you can also perform additional system set up and maintenance functions. These functions include setting up print and email drivers, tracking transactions, packing your database, and purging form sets, and transactions.

The ability to perform these functions depends on your security level as defined by your company. For specific steps for performing these tasks, see the supervisor guide.

## Chapter 3

# Selecting Forms

This chapter tells you how to open forms for data entry. When you choose File, New to open a new form, the Forms Selection window appears. From this window, you can perform a variety of tasks.

This chapter discusses the options you have while selecting forms:

- [Form Selection Overview on page 32](#)
- [Using the Forms Selection Window on page 33](#)
- [Selecting a Form on page 35](#)
- [Importing Information on page 38](#)
- [Duplicating a Form on page 43](#)
- [Modifying Recipient Form Copies on page 44](#)
- [Exiting the Forms Selection Window on page 45](#)

## FORM SELECTION OVERVIEW

The illustration below shows the basic task flow for selecting forms and entering data:

You select the transactions you want to work with and enter key field information, such as company name and line of business. Next, you select the forms you want to use, verify the recipients, and enter data.

USING THE FORMS  
SELECTION  
WINDOW

The Forms Selection window collects the information necessary to begin the entry process for your forms. The window is set up as a control grid for easy data entry and selection. The following provides a practical illustration to explain the data on the sample Forms Selection window, using an insurance company as the example.

Here is an example:

You are an agent for a large insurance company. You need to complete forms for a new business transaction. Your client is purchasing a commercial package policy from FormMaker Insurance. You have assigned the policy number as 7586934 and described the policy using the insured's name, Taylor Midland.

Under Available Forms, you see all forms available for processing FormMaker's commercial package insurance. This information is stored in the *form set definition table*, which is named the FORM.DAT file.

Transaction information appears in the top half of the window.

Double-click here to select all or clear all forms.

Information about the individual forms appears in the bottom half of the window.

| Inc                                 | Mode | Name           | Description                    | AGENT | HOME | INSURED |
|-------------------------------------|------|----------------|--------------------------------|-------|------|---------|
| <input checked="" type="checkbox"/> | E    | DEC PAGE       | Common Policy Declarations     | 1     | 1    | 1       |
| <input checked="" type="checkbox"/> | P    | FIL 1010 04 92 | Supplemental Declarations      |       |      | 1       |

| <input checked="" type="checkbox"/> | E    | IM DEC         | Inland Marine Declarations     | 1     | 1    | 1       |
| <input checked="" type="checkbox"/> | P    | FIM 0100 11 92 | Supplemental Form              | 1     | 1    | 1       |

The Forms Selection window is divided into sections. The top section contains transaction information. The bottom section contains forms information. The following table defines each field in the Forms Selection window.

| Field            | Description                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Transaction      | The type of process or business transaction associated with a particular form set. Examples: New Insurance Policy, Policy Renewal, Endorsement.     |
| Company          | The company associated with a form set.                                                                                                             |
| Line of Business | The specific business or industry associated with a form set. Examples: Automobile Insurance, Homeowner's Insurance, Commercial Property Insurance. |
| Policy Number    | A user-defined identifier (alphanumeric) associated with a specific form set.                                                                       |
| Description      | A user-defined description which identifies a specific form set. The insured's name is one example of a transaction description.                    |

| Field                       | Description                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inc                         | This column lets you include or exclude a form in a form set. You can double-click the column heading to select all forms. double-click again to clear all forms.                                                                                                                                                                                |
| Mode                        | Identifies the form type.<br><i>E</i> = Electronic. You can produce the form using the system.<br><i>P</i> = Pull Form. You cannot produce the form using the system. You must manually insert the hard copy form. Policy jackets are often designated as Pull forms.                                                                            |
| Name                        | Name of the form. The form name usually appears on the bottom of the printed form.                                                                                                                                                                                                                                                               |
| Description                 | General description of the form that indicates the form type.                                                                                                                                                                                                                                                                                    |
| Agent, Home Office, Insured | Form recipient columns. The number beside a specific form within a recipient column indicates the number of form copies for that recipient (Agent, Home Office, Insured). A blank space indicates that the recipient is not designated as a form recipient in the FORM.DAT file. You cannot enter a value where the table contains a blank cell. |

You can adjust the width of the columns by clicking and dragging the column divider lines.

The Forms Selection window also has options which let you work on specific forms before you begin entering data into the forms. The table below defines the options, and provides a page reference for the specific activity related to the option.

| Option    | Description                                                                                                                                                                                                                                                                                                                                                                               | See                                                            |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Retrieve  | Lets you open the Archive module to create a copy of an archived form set, and to edit the copied data. The original form data remains intact in archive because you edit only the copied data.                                                                                                                                                                                           | <a href="#">Archiving and Retrieving Form Sets on page 131</a> |
| Import    | Lets you select specific import files containing common data to apply to a particular form set. When you Import data, the system automatically prefills designated variable fields within your selected form set. Once the system fills the variable fields with imported data, you cannot alter that data. You can, however, enter and manipulate data in the remaining variable fields. | <a href="#">Importing Information on page 38</a>               |
| Duplicate | Lets you include an additional copy of a form in the Available Forms list. This option only works if the image creator designated the form as repeatable.                                                                                                                                                                                                                                 | <a href="#">Duplicating a Form on page 43</a>                  |

## SELECTING A FORM

Selecting a form lets you choose the specific forms in which to enter data. The Forms Selection window groups forms by company and line of business. You must select both the company and line of business to open a particular form set.

To select a form for entry:

- 1 Choose File, New. The Forms Selection window appears.

The Forms Selection window displays the following information:

- Transaction:** New Business
- Company:** FORMMAKER PACKAGE
- Policy #:** (empty)
- Description:** (empty)
- Available Forms Table:**

| Inc                                 | Mode | Name           | Description                    | AGEN | HOM | INSU |
|-------------------------------------|------|----------------|--------------------------------|------|-----|------|
| <input checked="" type="checkbox"/> | E    | DEC PAGE       | Common Policy Declarations     | 1    | 1   | 1    |
| <input checked="" type="checkbox"/> | P    | FIL 1010 04 92 | Supplemental Declarations      |      |     | 1    |
| <input checked="" type="checkbox"/> | E    | CG DEC         | General Liability Declarations | 1    | 1   | 1    |
| <input checked="" type="checkbox"/> | E    | FCG 0001 04 93 | General Liability Cov Form     |      |     | 1    |
| <input checked="" type="checkbox"/> | P    | FCG 0010 11 92 | Supplemental Form              |      |     | 1    |
| <input checked="" type="checkbox"/> | P    | FCG 2100 01 93 | Supplemental Form              | 0    | 0   | 1    |
| <input checked="" type="checkbox"/> | E    | FCD 0000 04 93 | Additional Insured             | 0    | 0   | 1    |

Buttons at the bottom: OK, Retrieve, Import, Duplicate, Cancel, Help.

- 2 Select the transaction type of your form set in the Transaction field. If there is only one transaction type available, the system automatically positions the cursor past the Transaction field.

**NOTE** To undo your selections and exit this window, click Cancel.

The Forms Selection window displays the following information:

- Transaction:** New Business
- Company:** FORMMAKER PACKAGE
- Policy #:** 7586934
- Description:** Taylor Midland
- Available Forms Table:**

| Inc                                 | Mode | Name           | Description                    | AGENT | HOME | INSURED |
|-------------------------------------|------|----------------|--------------------------------|-------|------|---------|
| <input checked="" type="checkbox"/> | E    | DEC PAGE       | Common Policy Declarations     | 1     | 1    | 1       |
| <input checked="" type="checkbox"/> | P    | FIL 1010 04 92 | Supplemental Declarations      |       |      | 1       |
| <input checked="" type="checkbox"/> | E    | CG DEC         | General Liability Declarations | 1     | 1    | 1       |
| <input checked="" type="checkbox"/> | E    | FCG 0001 04 93 | General Liability Cov Form     |       |      | 1       |
| <input checked="" type="checkbox"/> | P    | FCG 0010 11 92 | Supplemental Form              |       |      | 1       |
| <input checked="" type="checkbox"/> | P    | FCG 2100 01 93 | Supplemental Form              | 0     | 0    | 1       |
| <input checked="" type="checkbox"/> | E    | FCD 0000 04 93 | Additional Insured             | 0     | 0    | 1       |
| <input checked="" type="checkbox"/> | E    | FCP DEC        | Property Declarations          | 1     | 1    | 1       |
| <input checked="" type="checkbox"/> | P    | FCP 0120 10 92 | Supplemental Form              | 1     | 1    | 1       |
| <input checked="" type="checkbox"/> | P    | FCP 2040 01 91 | Endorsement                    | 0     | 0    | 0       |
| <input checked="" type="checkbox"/> | E    | IM DEC         | Inland Marine Declarations     | 1     | 1    | 1       |
| <input checked="" type="checkbox"/> | P    | FIM 0100 11 92 | Supplemental Form              | 1     | 1    | 1       |

Buttons at the bottom: OK, Retrieve, Import, Duplicate, Cancel, Help.

- 3 Select the company associated with the form set in the Company field.

- 4 Select the line of business in the LOB field. When you select a line of business, all forms related to the specific Company/LOB appear in the Available Forms list. For a package policy, you can select multiple lines of business. The forms for each line of business are included in the Available Forms list. An **X** appears in the Inc (Include) column beside each selected form. By default, the system selects all required forms.

---

#### Understanding the System

The FORM.DAT file defines the forms required for a given line of business. Your system supervisor can modify this file if necessary.

---

- 5 If your selected Company/LOB displays a long list of available forms, you can use the Forms Selection window's Search option to find the specific form either by form name or by form description. To use Search, double-click the Name or Description column heading. The Search window appears.

- 6 You can enter the complete form name or form description; or, you can click the Partial Match field and enter a partial string of characters.  
  
Click Find First to search for the first form whose name or description matches your entry. The form will be highlighted in the Forms Selection window. Click Find Next to continue the search. When the system reaches the end of the Available Forms list, the search complete message appears.
- 7 Click OK. Click the upper right corner, or Cancel, to close the Search window.
- 8 Type the numeric identifier for the form set in the Policy # field. You can enter up to 20 characters. Your entry must be unique.

---

**NOTE** If your system has been configured to use automatic policy numbering, the policy number will display in the Policy # field automatically. See the supervisor guide for details on setting up automatic policy numbering.

---

- 9 If you are entering information onto a new form set, type a description of the form set in the Description field. You can enter up to 30 characters. For existing form sets, this information has usually already been entered. This field is optional.
- 10 In the Inc column, click each form you want to deselect, if applicable. Deselected forms do not display in the Entry window. (The **X** in the Inc column does not appear next to a deselected form.) Your system may be configured to allow form selection by clicking the form row. See your system supervisor for information on this INI option.

You are now ready to perform other form selection activities, such as importing information, entering information, duplicating forms, and changing form recipient copy counts. Refer to the pages that follow for specific information.

## IMPORTING INFORMATION

As part of your system customization, your system supervisor can create a series of import files. These import files contain common data which you apply to a particular form set. When you import data, the system automatically prefills designated fields in the form set. Importing information saves time, avoiding the need to type information which is common to certain form sets. The system offers these import options:

- Standard import
- Full Document import
- Selective import
- Import from archive

## USING A STANDARD IMPORT

Your system supervisor can create numerous files, each of which applies to specific form sets in specific instances. When you perform a standard import, you select a particular import file from which to import data into your form set. Since there can be many import files, you must know the contents and functionality of each import file to ensure a successful import. Your system supervisor should inform you of each import file name and purpose before using the standard import option.

Using a standard import lets you import data into a form set. Follow these steps to perform a standard import:

- 1 Follow steps 1-7 for [Selecting a Form on page 35](#) then proceed with step 2 below:
- 2 Click Import to import data onto your forms. The Import Formats window appears.

- 3 Click the Standard Import option and then click Ok. The Select Import File window appears.

- 4 Select the import data file. Change the drive and directory if necessary. Click Ok. When you open the forms, the system imports the data into the correct variable fields.

## USING FULL DOCUMENT IMPORT

The Entry system offers an import/export format that combines WIP, NAFILE, and POLFILE information. Standard import does not contain a full document layout description of the document information and basically facilitates a field level interchange. Selecting Full Document import will import form, image and field information contained within a form set. Typically, this import option will not be available to the user since it performs the same function as emailing a form set in WIP. Its primary function is to export form sets from Entry for import into Documaker.

Follow these steps to perform a Full Document import:

- 1 Follow steps 1-7 for [Selecting a Form on page 35](#) then proceed with step 2 below:
- 2 Click Import to import data onto your forms. The Import Formats window appears.

- 3 Click the Full Document Import option and then click Ok. The Select Import File window appears.

- 4 Select the correct import data file. Your supervisor will tell you which import file contains WIP record information appended with standard NA and POL form set data. Change the drive and directory if necessary. Click Ok. When you open the forms, the system imports the form set with the correct data in the specified variable fields.

## USING A SELECTIVE IMPORT

When you perform a selective import, you select an import driver file which defines the import process. This driver file recognizes the transaction type (such as new, renewal, or endorsement), your company, and your user access level.

The driver file automatically selects those import files which apply to you. If your company uses the selective import option, your system supervisor should tell you which driver file to use.

Follow these steps to perform a selective import:

- 1 Follow steps 1-7 for [Selecting a Form on page 35](#), then proceed with step 2 below:
- 2 Click Import to import external data into your forms. The Import Formats window appears.

- 3 Click the Selective Import format option, and click OK. The Select Import File window appears.

- 4 Select the import driver file. Change the drive and directory if required. You need to check with your system supervisor to get the name of this file.
- 5 Click Ok. The Selective Import window appears.

| Company | User ID  | Transaction | Description |
|---------|----------|-------------|-------------|
| TESTCO  | FORMAKER | Endorsement | Comment8    |

The Selective Import window lists the files which are available for import depending upon the key fields, such as transaction, company, and line of business. Each import file listing also contains a brief description of the import file.

You can change the files available for import by changing the transaction and user ID options in the window. The user IDs available in the list, include your user ID as well as the user IDs of those who report to you, as defined when the system is first set up.

- 6 Select an import file available from the current list and click Ok. When you open the forms, the system imports the data into the appropriate variable fields.

## IMPORTING GLOBAL INFORMATION FROM ARCHIVE

This option lets you select a form set from the Archive window and, instead of retrieving the entire original form set as it is done with Archive Retrieval, only import the global data from that form set. This data (without the forms) is then available for the new form set you are creating.

---

**NOTE** This option must be set up by your system supervisor. If this option is unavailable, ask your system supervisor to set it up for you, using the instructions in the system supervisor guide.

---

Follow these steps to import global information from archive:

- 1 Follow steps 1-7 for [Selecting a Form on page 35](#), then proceed with step 2 below:
- 2 Click Import to import external data into your forms. The Import Formats window appears.

- 3 Click the Import from Archive option, and click OK. The Archive List window appears.

Double-click on these column headings to display the Search window so you can search for the form set you want, based on that heading.

- 4 Use this window to select the archive form set from which you want to import global data. Highlight the form set you want and click Ok.

---

## Understanding the System

The option does not select forms for you; it simply imports global data. Fields which contain global data are designated when the form is created.

---

## Importing Data with Forms and Images from Archive

Your system supervisor can configure the Import From Archive option to transfer data with forms and images from archive if the form and image names match.

For instance, if the archived form set consists of **FORM\_A** and **FORM\_B** and you currently have **FORM\_A** and **FORM\_B\_v2** selected, the system transfers the form data from **FORM\_A** plus any global fields set up for the entire form set. Since **FORM\_B** does not match **FORM\_B\_v2**, no form or image level information is transferred between the form sets. Similar name matching is required at the image levels.

The import operation reselects the forms based upon those found in the archive. Any prior form selection made in the Forms Selection window is removed. The archive index record information is transferred to the WIP record information and the system updates the Form Selection window to show any changed values.

---

**NOTE** Multi-line text fields will retain paragraph markers but will not retain any text formatting.

---

## DUPLICATING A FORM

Duplicating a form lets you include an additional copy of a form in the Available Forms list. You can duplicate a form to accommodate *overflow* information such as multiple insurance schedules. You can duplicate only forms that are designated by the image creator as repeatable forms (this information is stored in the FORM.DAT file).

To duplicate a form, click the form you want to duplicate, then click the Duplicate button. The system lists the duplicated form on the line below the original form in the Available Forms list.

**NOTE** You cannot duplicate more than one form at a time. You must select each form to duplicate individually.

## MODIFYING RECIPIENT FORM COPIES

Modifying recipient form copies lets you change the number of form copies for any or all recipients. You cannot, however, change the assigned recipients of any form.

- 1 To modify recipient form copies, click the recipient copy count you want to change. The system highlights the cell when you select it.

OK Retrieve Import Duplicate Cancel Help

- 3 Enter the new copy count and click Ok. The recipient's copy count for all forms selected will be set to the new number.
- 4 Click Ok to display your selected forms in the Entry window. The forms you selected for entry display in the order in which they appeared in the Available Forms list. If you choose to import data, the data appears in the applicable fields.

## EXITING THE FORMS SELECTION WINDOW

Exiting the Forms Selection window lets you exit the window without saving your forms configuration.

Click the upper right corner of the window, or Cancel, to exit the window. You return to the main window.

The screenshot shows the 'Forms Selection' window. At the top, there are fields for 'Transaction' (New Business), 'Company' (FORMMAKER PACKAGE), 'Policy #' (7586934), and 'Description' (Taylor Midland). To the right, under 'COMMERCIAL PACKAGE', are checkboxes for 'GENERAL LIABILITY', 'PROPERTY', and 'INLAND MARINE'. Below these is a table titled 'Available Forms' with columns: Inc, Mode, Name, Description, AGENT, HOME, and INSURED. The table lists various forms with their respective modes and values in the AGENT, HOME, and INSURED columns. At the bottom of the window are buttons for 'OK', 'Retrieve', 'Import', 'Duplicate', 'Cancel', and 'Help'.

## Chapter 4

# Completing Forms

Documaker Workstation displays forms on your screen and lets you enter data directly into the form's fields. While entering data, you can select from tables, display field-specific Help information, and use Text Editor options. These additional capabilities are set up by the person who created the form set.

As you enter data, tables provide a list of valid field entries you can select. Help provides prompts, messages, and other information specific to the field in which you enter data. The Text Editor lets you enter and format multiple lines of text and other data. See [Using the Text Editor on page 50](#) for more information on using the Text Editor.

This chapter discusses the following options:

- [Entering Information on page 48](#)
- [Using Field Help on page 51](#)
- [Using Tables on page 52](#)
- [Using Microsoft Word For Text Entry on page 53](#)
- [Saving Your Work on page 54](#)
- [Completing a Form Set on page 55](#)
- [Exporting Information on page 56](#)

## ENTERING INFORMATION

You enter information into *variable fields*. These fields are set up when the form is created. If you selected the Import option on the Forms Selection window, the imported data appears in the appropriate fields when you display the form set.

You can enter information directly onto the form or use the Fixed Edits option to first enter the data in the Data Entry field. This topic discusses how to enter data directly onto the form. See [Using the Data Entry Field on page 50](#) for more information about that option.

Follow these steps to enter information into a variable field:

- 1 Click a variable field. The system highlights the first variable field on the first form in the form set by default. The field type appears in the status bar at the bottom of the window. Field types include:

| Type                     | Description                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alphabetic               | Accepts only alphabetic letters.                                                                                                                                                                                                                                                                                                             |
| Int'l Alphabetic         | Accepts international alphabetic letters.                                                                                                                                                                                                                                                                                                    |
| Alphanumeric             | Accepts a combination of alphabetic letters and numbers.                                                                                                                                                                                                                                                                                     |
| Int'l Alphanumeric       | Accepts a combination of alphabetic letters and numbers, including international letters and numbers.                                                                                                                                                                                                                                        |
| Bar code                 | Displays bar-coded information.                                                                                                                                                                                                                                                                                                              |
| Custom                   | Accepts data based on field type. A systems integrator can customize the field types.                                                                                                                                                                                                                                                        |
| Date format              | Accepts dates in the format indicated. You can enter dates from 1800 to the year 3000.                                                                                                                                                                                                                                                       |
| Multi-line text          | Accepts multiple lines of text to which word processing options may be applied. The form's creator can configure the form to enter text using Microsoft Word (see <a href="#">Using Microsoft Word For Text Entry on page 53</a> ) or by using the Text Editor. (See <a href="#">Using the Text Editor on page 54</a> for more information.) |
| Numeric                  | Accepts only numbers.                                                                                                                                                                                                                                                                                                                        |
| Table only               | Accepts table selections.                                                                                                                                                                                                                                                                                                                    |
| Upper Alphabetic         | Accepts only capital letters (defaults text to all upper case).                                                                                                                                                                                                                                                                              |
| Int'l Upper Alphabetic   | Accepts only capital letters (defaults text to all upper case), including international letters and numbers.                                                                                                                                                                                                                                 |
| Upper Alphanumeric       | Accepts a combination of alphabetic letters and numbers (defaults text to all upper case).                                                                                                                                                                                                                                                   |
| Int'l Upper Alphanumeric | Accepts a combination of international alphabetic letters and numbers (defaults text to all upper case).                                                                                                                                                                                                                                     |
| X or space               | Accepts an X or blank space.                                                                                                                                                                                                                                                                                                                 |
| Y(es) or N(o)            | Accepts Y or N.                                                                                                                                                                                                                                                                                                                              |

---

**NOTE** The system displays the status bar by default. To hide the status bar, choose Options, Information.

---

- 2 Type the data in the appropriate format, and press **TAB** to accept the data and move to the next variable field. (You cannot edit imported data unless your system has been configured to do so in the INI file.)

If the image's creator has activated the spell check option for the variable field, the data you entered will be checked for accuracy when you press **TAB**. If the image's creator has not selected the spell check option, spell checking of variable fields is unavailable during entry unless you have had a spell check option added to your menu. For information on adding this menu option, see [the Documaker Workstation Supervisor Guide](#)

---

**NOTE** If you receive an error message when entering data, retype data in the field and press **TAB**. If you cannot enter data, or you enter data that is inconsistent with the data type, check with the image creator or with your system supervisor to verify the correct data type.

---

## USING THE DATA ENTRY FIELD

Entering variable field data using the Data Entry field lets you enter and edit data before you actually add it to the field on the form.

To enter data using the Data Entry field:

- 1 Select Options, Fixed Edits. The system displays the Data Entry field directly below the toolbar. The first variable field in the first image of the form set is highlighted by default. To select a different variable field, click it.

Data Entry Field, shown with the Fixed Prompt option turned off.

The screenshot shows a software window titled "Processing System" with a menu bar (File, Edit, Retrieve, View, Format, Tools, Options, Window, Help) and a toolbar. Below the toolbar is a "Data Entry Field" with a "Fixed Prompt" option turned off. The main form area is titled "COMMERCIAL LINES POLICY COMMON POLICY DECLARATIONS". It contains several sections: "Form Maker Insurance Company" (with a logo), "Renewal of Number" and "Policy No." fields, "Named Insured and Mailing Address" (with a list of addresses), "Policy Period" (with "From" and "to" fields), "Business Description" (with a text area), and a table titled "THIS POLICY CONSISTS OF THE FOLLOWING PARTS:". The table has two columns: "Coverage Part" and "Premium". The rows are "Commercial Property Coverage Part" and "Commercial General Liability Coverage Part". The status bar at the bottom shows "1 | Alphabetic RENEWAL NBR" and "RENEWAL NBR".

- 2 Type the data in the appropriate format; then, press **TAB** to apply the data to the image's variable field and move to the next variable field. For information about field formats, see [Entering Information on page 48](#)

## USING FIELD HELP

Using Field Help lets you display help messages the image creator has attached to variable fields. Help messages provide information to assist you in completing field entries. A variable field with a help message attached will activate the toolbar's Field Help icon when you click the variable field. For more information on toolbar icons, see [Using the Toolbar on page 19](#)

To enter data using field help:

- 1 Click a variable field.
- 2 Click the Field Help icon to display the help message attached to the field.

- 3 Read the help message for information about the data you enter into the field. Click Ok to close the message.

## USING TABLES

Tables contain lists of options you can choose from to fill in a field. A field which has a table attached will activate the Table icon on the toolbar when you click in the field.

---

**NOTE** For more information on toolbar icons, see [Using the Toolbar on page 19](#)

---

To enter data using a table:

- 1 Click in a field on the form.
- 2 Depending on how the form creator set up the field, the table may display automatically. If the table does not display automatically, click the Table icon.

This is the key

This is the description

- 3 Click the entry you want in the table window. As shown in the example above, table entries appear in Key (Code) and Description format (Key/Code = *AR*, Description = *Arizona*).
- 4 Click Ok to enter your selection in the field. The field accepts either the Key, the Description, both, or no entry, depending on how the image creator set up the field. If you do not select a table entry, a default entry does not appear in the field. The field remains blank.

---

**NOTE** Depending on how the form creator set up the form, you may be able to type in an entry if the table does not offer an option which meets your needs. For some fields, the form creator may require that you select an entry from the table. The system tells you if you must select an entry from the table.

---

## USING MICROSOFT WORD FOR TEXT ENTRY

Multi-line text fields let you enter large blocks of information in free-form text which can be formatted using word processing features. Depending on how the form was designed, you may be able to enter this text using Microsoft Word instead of the system's Text Editor. The text is saved in RTF format which Documaker Workstation then incorporates into the form.

**NOTE** This capability is added to the form by the person who designed the form and may not be available. For more information, talk to your system supervisor.

To use Word for text entry:

- 1 Click or tab to the multi-line text field. The system displays the Edit Manuscript Entry window.

- 2 Click Yes to open Microsoft Word and have the information that appears on the form sent to it. A status window is activated in Entry:

- 3 While Word is open, only the Help and Force Reload Now buttons are available. The Force Reload Now button lets you force the loading of the file in case there is a communication error with Word.

When you have finished entering and formatting the text in Word, use the File, Save As option to save the text, accepting the default file name assigned by Word. Close Word to return to the entry window.

- 4 Click Ok in the Manuscript Form window to import the text. The Edit Manuscript Entry window appears. Click Yes to reopen Word and edit the text. Click No to accept the text and continue completing the form.

Information on the system's Text Editor appears in [Chapter 5, Using the Text Editor on page 59](#)

## SAVING YOUR WORK

To save your work and continue working on the form, choose the File, Save option.

The Save option lets you save changes to your form set without exiting the system. You should save your work at regular intervals.

To save form set data and continue to work on the form, choose File, Save; or, click the Save icon on the toolbar. The system saves your form set data changes.

The screenshot shows the 'Processing System' window. The 'File' menu is open, and the 'Save' option is highlighted. The main form area displays 'COMMERCIAL LINES POLICY COMMON POLICY DECLARATIONS' with a 'Policy No. 34673467834'. Below this, there are fields for 'Named Insured and Mailing Address', 'Policy Period', and 'Business Description'. At the bottom, a table lists policy parts: 'Commercial Property Coverage Part', 'Commercial General Liability Coverage Part', and 'Commercial Auto Coverage Part', each with a corresponding 'PREMIUM' field.

When you exit the window, the system records all changes since your last save and stores the form set as WIP (work-in-process).

**NOTE** The system can automatically save your work at specific intervals. This feature is set up by your system supervisor. Check with your system supervisor for more information.

To save the form set and have the system automatically close it, use the WIP, Save option, as shown in this excerpt:

To save your work and close the form, choose the WIP, Save option.

The screenshot shows the 'Processing System' window. The 'WIP' menu is open, and the 'Save' option is highlighted. The main form area displays 'COMMERCIAL LINES POLICY COMMON POLICY DECLARATIONS' with a 'Policy No. 34673467834'. Below this, there are fields for 'Named Insured and Mailing Address', 'Policy Period', and 'Business Description'. At the bottom, a table lists policy parts: 'Commercial Property Coverage Part', 'Commercial General Liability Coverage Part', and 'Commercial Auto Coverage Part', each with a corresponding 'PREMIUM' field.

COMPLETING A FORM SET

Complete lets you save your form set data entry changes and select various print and archive options upon data entry completion.

Follow these steps to complete a form set:

- 1 Choose File, Complete. The Complete window appears.

- 2 Select the form set completion options. This table defines options available on the Complete window:

| To...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Choose      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| Either print the form set immediately or send the form set to batch Print print.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |             |
| Send the print job to a batch queue so it can be printed at a later time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Batch Print |
| Print a form set immediately. When you select the Immediate Print option, the system displays the Print window. See <a href="#">Printing Form Sets on page 93</a> for additional information.                                                                                                                                                                                                                                                                                                                                                                                                                       | Print       |
| Archive a form set immediately upon completing data entry. If your Archive system is set up to automatically archive form sets when you select Complete, the mode indicator below the Archive option displays <i>Auto</i> , and the Archive option is checked by default. If your system is configured for manual archive, the mode indicator displays <i>Manual</i> , and you must archive the form set after printing, using the WIP, Manual Archive option. Archive options are defined by the system supervisor. See <a href="#">Archiving and Retrieving Form Sets on page 101</a> for additional information. | Manual      |
| Export data you entered in the system for use in other applications. The system lets you export data with a policy header to indicate the policy data origination point. You can export data without a header to get a file which contains only raw data. Export options, export data storage paths, and header/no header options are defined by your system supervisor.                                                                                                                                                                                                                                            | Export Data |

- 3 Click Ok. The system saves changes to your form set and performs whichever additional options you selected.

See [Printing Form Sets on page 93](#) and [Archiving and Retrieving Form Sets on page 101](#) for more information about print and archive options.

## EXPORTING INFORMATION

You can export data when you complete a form set, or export data without printing or archiving (completing) the form set. Check with your system supervisor for specific information about export formats and file naming conventions before you export information.

**NOTE** See the supervisor guide for more information about exporting information and additional options you can set up.

To export data, choose File, Complete. The Complete window appears.

- 1 Select your print and archive options. If your system is configured for automatic archive, the Archive option is unavailable.
- 2 Click the Export Data field to export the form set data. The export formats you can choose appear below the field.

**NOTE** This topic discusses exporting data and information from form sets. To export data from specific variable fields, see [Using the Field-only Export Option on page 57](#).

- 3 Choose an export format. A brief description of your options appears below.

| To export the data to a file that can be...                                                                                                                      | Choose               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| Imported by the system.                                                                                                                                          | Export Version 2     |
| Used in other applications. This type of export file contains form (or policy) information along with the data.                                                  | Standard Export      |
| Used in other applications. This type of export file contains data only; there is no form (or policy) information included.                                      | Export No Header     |
| Imported into Documaker. This format combines WIP, NAFILE, Full Document and POLFILE information. This option must be installed by the Export system supervisor. | Full Document Export |

- 4 Click Ok. If you choose to print, archive and export simultaneously, the system displays a print window.

- 5 Select the appropriate print options and click Ok. The Export File As window appears. See [Printing Form Sets on page 93](#) for specific information on printing form sets.

- 6 Type or select the export data file in the File Name field. By default, the export file is placed in the working directory. In the appropriate fields, you can change the drive and directory, if required.
- 7 Click Ok. The system prints and archives the form set, based on your selections, and creates an export file containing the form set data.

## USING THE FIELD-ONLY EXPORT OPTION

The standard export feature outputs all form and field information contained in a form set. In some cases, you may want to extract only certain field information (like accounting data) from the form set without having to wade through all the field and header information included in the standard export. If installed, you can use the Field-only export option to limit the exported output to specific fields.

Your system supervisor must first install the Field-only export option onto your system. Once installed, you can create an export file which contains only the information you want. After your system supervisor installs this export method, the Field-only export option appears on the Complete Formset window, along with the other export options.

In general, this export method lets you specify which fields should be written to the export file. Each field is located by name, regardless of which form (or image) contains the information. Rather than output the same field and data numerous times, this export option only writes the first occurrence of any specified field in the form set.

Once installed, the option appears as a choice in the Export list, as shown below.

Choosing this option tells the system to write to the export file those fields specified in the ExportFields INI control group.

## Chapter 5

# Using the Text Editor

This chapter discusses using the Text Editor. The Text Editor appears when you enter or edit data in *multi-line text field* on the Entry window.

A multi-line text field differs from other variable fields in that it lets you enter a large block of free-form text, and its content is limited only by the size of the area, which can optionally grow or shrink as necessary. The size of the text area is set up by the person who created the image.

Use the Text Editor to enter and format the text, find and replace text, check spelling, and insert text from another file. If you have worked with word processing packages, many Text Editor options will be familiar to you.

This chapter discusses...

- [Using the Text Editor Menus on page 60](#)
- [Using Paragraph Assembly on page 64](#)
- [Inserting Breaks, Files, and Boxes on page 66](#)
- [Formatting Text on page 70](#)
- [Adding Color to Text on page 81](#)
- [Checking Your Entries on page 83](#)
- [Using the Find/Replace Option on page 89](#)
- [Using Help on page 90](#)
- [Shortcuts for Formatting Text on page 91](#)

Remember, the Text Editor is available only for multi-line text fields. Additionally, you may have the option of using Microsoft Word to enter text. See [Using Microsoft Word For Text Entry on page 56](#) for more information.

## USING THE TEXT EDITOR MENUS

The system displays the Text Editor Entry window when you begin typing in a multi-line variable field or press F3. The Text Editor menu appears at the top of the window. This menu provides text entry and formatting options.

The following tables describe the Text Editor menu options.

**NOTE** The system provides a way to customize Text Editor menus and toolbars. This manual discusses the default menus and toolbar. If your system differs, or if you want to customize this menu, contact your system supervisor.

### File menu options

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select           | Select and deselect text or columns. Click cHaracter, Word, Line, Paragraph, Column, or All to highlight the appropriate text, or click Deselect to remove highlighting from selected text.                                                                                                                                                                                                                       |
| Bold             | <b>Bold</b> selected text.                                                                                                                                                                                                                                                                                                                                                                                        |
| Italic           | <i>Italicize</i> selected text.                                                                                                                                                                                                                                                                                                                                                                                   |
| Underline        | <u>Underline</u> selected text.                                                                                                                                                                                                                                                                                                                                                                                   |
| Strike-out       | <del>Strike-out</del> selected text.                                                                                                                                                                                                                                                                                                                                                                              |
| Do Not Hyphenate | Tell the system not to hyphenate the selected text. You can use the Hyphenation option on the Paragraph window (Tools, Paragraph) to set hyphenation for a paragraph. Select this option again to deselect it.                                                                                                                                                                                                    |
| Do Not Break     | Tell the system not to break the text label or embedded field your cursor is in. Select this option again to deselect it.                                                                                                                                                                                                                                                                                         |
| Color            | Add color to selected text. Highlight the text you want to color, then choose this option. If you select a color with no text highlighted, the text you enter next appears in the selected color. If you have a color printer and if you select the Print in Color option on the Color window, the text prints in the color you selected. See the supervisor guide for information about the correct INI setting. |

|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zoom               | Zoom in or out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Status Line        | Display or hide the status line. The status line tells you the X (horizontal) coordinate and baseline Y (vertical) coordinate of your cursor. The X coordinate is the location of your cursor in relation to the left-hand margin of the image. The baseline coordinate is the location of your cursor in relation to the top margin of the image, not the Text Editor entry window. The status line also shows you the current font ID. The system defaults this option <b>on</b> . |
| Nonprinting Tokens | Display or hide formatting symbols such as paragraph markers and tab markers.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Rulers             | Display or hide the horizontal and vertical rulers.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Title bar          | Display or hide title bars for each form you display.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Toolbar            | Display or hide the toolbar. The system defaults this option <b>on</b> .                                                                                                                                                                                                                                                                                                                                                                                                             |

This option... Lets you...

|               |                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refresh       | Refresh the window to ensure that the current window shows all changes and additions.                                                                             |
| Reformat      | Reformat the text. Use after you have made significant formatting changes.                                                                                        |
| Level Columns | Balance the distribution of text in columns. You must first check the Automatic Column Leveling field in the Columns window (Format, Columns) to use this option. |

### Insert menu options

| Product Information | View product information such as version and patch information.             |

## USING PARAGRAPH ASSEMBLY

The system contains an automatic paragraph assembly option. The form creator can create paragraph blocks in a table, which you can use while entering information.

Paragraph blocks created for assembly are usually model text appearing on a particular form, such as a disclaimer or general insurance information. You can select and assemble paragraphs in an order that is specific to the form set. After you assemble paragraphs, you can edit the text to meet your particular needs.

You get to the paragraph blocks from a multi-line text variable field.

**NOTE** An image's creator can restrict paragraph selection to one item only. In that case, the user will only be able to select one paragraph from the list for insertion into the text area. Additionally, if the image's creator has marked a paragraph as No User Edit, the text is protected from any changes by the user during entry.

## ASSEMBLING PARAGRAPHS

To assemble paragraphs:

- 1 Place your cursor in the multi-line text variable field from which paragraph assembly is available. The Paragraph Selection window appears.

- 2 An image's creator can list available paragraphs by key, by description or by key and description. Click the first paragraph in the Available Paragraphs list that you want to appear in the text area, then click Add. The paragraph appears in the Selected Paragraphs list. Repeat this step for each paragraph you want to place in the multi-line text field. To locate a paragraph quickly, enter the first few letters of the paragraph key in the Locate field. The paragraph is highlighted in the Available Paragraphs list. Click Add to place the paragraph in the Selected Paragraphs list.
- 3 To organize the placement of the paragraphs within the text field, click the paragraph in the Selected Paragraphs list that you want to move, then click Up to place your selected paragraph before the paragraph above it, or click Down to place your selected paragraph after the paragraph below it.

- 4 Click Replace Existing Paragraphs to overwrite existing text with your assembled paragraphs in the multi-line text field or click Append To Existing Paragraphs to place your assembled paragraphs after existing text in the multi-line text field.

The system displays the assembled paragraphs in the multi-line text field. If the image's creator has not marked the text as protected, you can edit the assembled text by going to the Text Editor from the multi-line text field. The remainder of this chapter covers Text Editor options.

## INSERTING BREAKS, FILES, AND BOXES

Insert options let you place text breaks, text files, logos, and boxes in the text area. You choose the appropriate insertion point for these options. Insert page, column, or line breaks to change the formatting and flow of your text. Insert text files to save text entry time. Insert logos to incorporate graphics that help draw attention to specific information. Insert boxes to highlight specific text.

### INSERTING A BREAK

The Break option lets you insert a line, page, or column break at any point in the text area. To insert a break, place your cursor where you want to insert a break, then choose Insert, Break. The Break window appears:

Click Line, Page, or Column Break to insert the break in the text area. Click Ok. You return to the text area.

### INSERTING A FILE

The File option lets you insert an entire file into the text area. By inserting a file, you eliminate the need to re-enter text and save time. You can insert a file in ASCII format into the text area.

To insert a file, place your cursor where you want to insert a file; then, choose Insert, File. The Insert File window appears:

The system defaults to the drive and directory where it stores your forms. Select the file you want to insert and click Ok. The file you selected is inserted at your cursor point.

## INSERTING A LOGO

The Logo option lets you insert a logo into the text area. You can place a graphic, logo, picture, or signature in your text area. You insert graphics from a system bitmap file, which ends in a LOG extension.

To insert a logo, place your cursor where you want to insert a logo, choose Insert, Logo. The Locate Bitmap window appears:

Click the logo, then click Ok. The logo is inserted in the text area.

**NOTE** The first time you select Insert, Logo the Locate Bitmap window is empty. See the following topic for information on how to insert LOG files in this window. After you add LOG files, they remain available throughout your work session.

## Adding a Logo to the Locate Bitmap Window

To add a Logo to the Locate Bitmap window, you can insert a file or you can insert from a library. When you insert a file, you are adding the original LOG file.

**NOTE** You cannot insert a LOG file from a library if you have not set up Library Manager files.

### Inserting a logo

Follow these steps to insert a logo file:

- 1 Click Insert File to display this Open Logo window:

- 2 Type the file name in the File Name field or select a file from the list. Change the drive and directory if necessary.
- 3 Click Ok. The file is inserted in the Locate Bitmap window. Any file you add to the Locate Bitmap window remains there and is available throughout your work session.
- 4 Within the Locate Bitmap window, click the logo; then click Ok. The logo is inserted in the text area.

#### Inserting a logo from a library

Follow these steps to insert a logo file from a library:

- 1 From the Locate Bitmap window, click Insert From Library. The Open Logo window appears:

- 2 Click the LOG file you want.
- 3 Click Ok. The LOG file is inserted into the Locate Bitmap window. Once you add LOG files to this window, they remain available throughout your work session.
- 4 Repeat steps 1 through 4 for each LOG file version you want to list in the Locate Bitmap window.
- 5 Within the Locate Bitmap window, select the logo you want to insert; then, click Ok. The logo is inserted into the text area.

## INSERTING BOX

The Box option lets you insert a box into the text area. You can place a box within the text area to emphasize specific text. You can use different line weights and patterns for the edges of the box.

Follow these steps to insert a box:

- 1 Place your cursor where you want to insert a box, then choose Insert, Box. The Box window appears:

- 2 Type or select the width and height of the box in the Size field.
- 3 Type or select the weights for the horizontal and vertical box lines in the Weights field.
- 4 Select the line pattern in the Pattern field. Fifteen patterns are available. Click the drop down arrow to see the complete list of available patterns.
- 5 Click Color to display the color window. Click the line color and click Ok. You return to the Box window.
- 6 Click Top, Bottom, Left, or Right in the Draw Edges field to select the sides of the box you want to display. Click Ok. The box is inserted in the text area and you return to the Text Area Entry window.

## FORMATTING TEXT

Format options let you assign a full range of fonts to the text within your multi-line text variable field. You can also format the text by using alignment and indentation options, borders and shading, or by creating columns.

### CHOOSING A FONT

Font options let you apply various fonts to text within a multi-line text area. The creator of the image chooses the font set for the image and determines the available fonts. If you do not select a new font, the system applies the default font.

To choose a font:

- 1 Select Format, Font. The Select Font window appears.

- 2 Select the font you want to use. You can select a font several ways:

Enter the font ID in the Font ID field

Select the font family in the Family field and then select the size and style in the Point Size and Style fields.

Click the font you want in the list of fonts. Click the List all fonts field to see all available fonts.

The system shows you a sample of the font in the Sample field. Click the Actual Size field to view the point size you selected.

- 3 Once you select the font you want, click Ok. You return to the Text Editor window.

### FORMATTING A PARAGRAPH

The Paragraph option lets you format complete paragraphs or highlighted blocks of text within the text area. You can apply justification, indentation, and line spacing options. Justification and indentation options are relative to the left and right margins of the text area.

To apply Paragraph options, place your cursor within the paragraph you want to format or highlight a block of text, then choose Format, Paragraph. The Paragraph window appears:

- 1 Type or select the indentation in the Left and Right Indentation fields. The minimum available indentation spacing is .01 inches.
- 2 Select one of the following indentation options in the Indentation field.

If you want the paragraph formatted so the...

Select...

Left margin is justified

Normal

First line hangs to the left of the remainder of the paragraph.

Hanging

*This is an example of a paragraph with hanging indentation.*

First line is indented, the remainder of the paragraph is left justified. First Line

*This is an example of a paragraph with first line indentation.*

If you selected Hanging or First Line, type or select the indentation length in the Indentation Units Field to the right.

- 3 Use the Spacing field to determine how much space is placed between lines of text in the text area. For example, you can choose to single or double your text or you can set up a custom spacing setting if you like. Here is a summary of your options:

If you want

Choose

The line spacing to be determined by the font size.

Single

The line spacing to be determined by the font size with one blank Double line between each line of text.

To specify the exact line spacing.

Exactly

The line spacing to be at least the value you enter. This means At least that the line spacing can be more than the entered value, but not less.

The line spacing to be based on the multiple you enter in the Times field.

Multiple

---

**NOTE** If you select Exactly or At least, you must specify the amount of spacing. You can choose from 6, 7, or 8 lines per inch (LPI) or select Custom and enter a specific value.

---

- 4 Type or select the amount of spacing you want to appear above and below the paragraph. This determines the amount of white space above the first line and below the last line of your paragraph.
- 5 Check the Hyphenation field if you want the system to hyphenate words for you. Remove this check if you do not want the system to split words. You can specify a language for hyphenation rules if necessary.
- 6 Use the Pagination options to specify whether or not you want the system to break this paragraph if it nears the end of the page or if you want to keep this paragraph with the next paragraph.
- 7 Click the Left, Left and Right, Centered, or Right option to select the justification.
- 8 If you want to set tabs or add a border, use the following buttons:

Click... Then...

|        |                                                                                                                                                                                  |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tabs   | On the Tabs window, click the tab stops you want and click <b>OK</b> . You return to the Paragraph window. (See the topic below for a complete explanation of tab selections.)   |
| Border | On the Border window, click the border you want and click <b>OK</b> . You return to the Paragraph window. (See the topic below for a complete explanation of border selections.) |

Click **OK** to apply your text paragraph formatting. You return to the Text Area Entry window.

## SETTING TAB STOPS

The Tab Stops option lets you set the default tab stops for the text area. You can also define specific tab stops of varying lengths and select the type of leaders (periods, dashes, underscores, or none) for tabs.

To select tab stops, choose **Format, Tab Stops**. The Tab Settings window appears:

If you are using a different unit of measure, such as centimeters, the names of these fields will change accordingly.

### Setting default tab stops

Follow these steps to set up default tab stops. You can later customize these tab stops as necessary.

- 1 Type or select the default length for tab stops in the Default Tab Stops field.
- 2 Click Ok. You return to the Text Area Entry window.

### Setting custom tab stops

Follow these steps to set up custom tab stops.

- 1 Select a tab length in inches in the In (inches) Field. If you are using a different unit of measure, such as centimeters, this field will have a different name.
- 2 Select a tab type in the Tab Type field. You can choose a left, right, center, or decimal tab type.

If desired, select a leader in the Lead With field. You can select periods, dashes, underscores, or none to precede the tab stop.

- 3 Click Insert. Your new tab stop appears in the Tab Stops list to the left. You can add as many tab stops as necessary. Click Ok to return to the Text Area Entry window.

### Changing tab stops

Follow these steps to change tab settings:

- 1 Click the tab stop you want to change in the Tab Stops list.
- 2 Make the appropriate changes in the In (inches), Tab Type, and Lead With fields.
- 3 Click Change. The Tab Stops list shows you the new tab stop length.
- 4 Click Ok. You return to the Text Area Entry window.

### Deleting tab stops

Follow these steps to delete tab stops:

- 1 Click the tab stop you want to delete in the Tab Stops list.
- 2 Click Delete. The tab stop is removed from the list.
- 3 Click Ok. You return to the Text Area Entry window.

## ADDING BORDERS

Border lets you place a border around selected text. Use a border to draw attention to text or to segment specific information.

To place a border around text, place your cursor in the paragraph you want to format or highlight a block of text; then, choose Format, Border. The Border window appears:

- 1 Type or select the line weights for the horizontal and vertical borders in the Line Weights field. Horizontal line weights can vary from vertical line weights.
- 2 Select Top, Bottom, Left, Right, or any combination thereof, in the Draw Edges field. Draw Edges determines where the border appears around the text.
- 3 Type or select a value in the From Text field to determine the distance between the border and the text.
- 4 Select a pattern in the Pattern field.
- 5 Click Color to select a color for the border. Select a color in the color field and click Ok. You return to the Border window.
- 6 Click Ok. You return to the text area.

**Deleting a border** Follow these steps to delete a border:

- 1 Highlight the area from which you want to delete the border.
- 2 Open the Border window.
- 3 Click Delete.
- 4 Click Ok. The border is removed and you return to the text area.

## ADDING SHADE

Shade lets you place shading behind selected text. You shade text to draw attention to it, to segment specific information, or to create contrast on your page.

To shade text, place your cursor within the paragraph you want to format or highlight a block of text, then choose Format, Shade. The Shade window appears:

- 1 Type or select a value in the From Text field to determine the vertical distance between the shading and the text.
- 2 Select a pattern in the Pattern field.
- 3 Click Color to select a color for the shading. Select a color in the color field and click Ok. You return to the Shade window.
- 4 Click Ok. You return to the Text Area Entry window.

**Removing shading** Follow these steps to remove shading:

- 1 Highlight the area from which you want to delete the shading.
- 2 Display the Shade window.
- 3 Click Delete.
- 4 Click Ok. You return to the Text Area Entry window.

## ADDING COLUMNS

Columns lets you place columns in the text area. You can use newspaper style columns in your text area. Text flows from one column to another. Columns can be of equal or unequal widths. Use columns to create a professional and easy to read appearance for large amounts of text.

To create columns, choose Format, Columns. The Columns window appears:

### Setting up columns using the Quick Setup option

Follow these steps to quickly set up columns:

- 1 Click Quick Setup. The Quick Column Setup window appears.

- 2 Type or select the total number of columns you want in the text area in the Number of Columns field.
- 3 Type or select the distance between columns in the Space Between Columns field.

**NOTE** You must enter a distance or the columns are positioned directly adjacent, with no space between them.

- 4 Click Ok. You return to the Columns window. To insert a line to the right of a column in the list, click the column, then enter the divider line weight in the Weight field.
- 5 Select the divider line pattern in the Pattern field. Fifteen patterns are available. Click the drop down arrow to see the complete list of available patterns.
- 6 Click Color to display the Color window. Click the Default check box to remove the check mark and then click the line color. Click Ok. You return to the Columns window.

- 7 Click Change to save the divider line selections.
- 8 Click Automatic Column Leveling to balance the text distribution between columns. Click OK. You return to the Text Area Entry window.

---

**NOTE** Your calculated column widths and the text area's total available width appear at the bottom of the Columns window.

---

### Setting up individual columns

Follow these steps to set up each individual column:

- 1 Enter the width for the first column in the Column Width field.
- 2 To insert spacing between this column and the next column, enter a value in the Right Margin field.

---

**NOTE** The default is no spacing between columns. You must enter a spacing selection or the columns appear connected.

---

- 3 To insert a line to the right of this column, enter the divider line weight in the Weight field.

---

**NOTE** You can place a divider line to the right of every column in the text area, except the last column.

---

- 4 Select the line pattern in the Pattern field. Fifteen patterns are available. Click the drop down arrow to see the complete list of available patterns.
- 5 Click Color to display the Color window. Click the Default check box to turn off the check mark, then click the line color. Click Ok; you return to the Columns window.
- 6 Click Insert. Your first column appears in the list window.

---

**NOTE** Repeat steps 1-6 for each column you want to create in the text area.

---

- 7 Click Automatic Column Leveling to balance the text distribution between columns. Click Ok. You return to the Text Area Entry window.

**Changing column settings** Follow these steps to change column settings:

- 1 In the Columns list, click the column you want to change.
- 2 Make the changes in the Column Width, Space to Right, and Divider Line Weight fields.
- 3 Click Change.
- 4 Click Ok. You return to the Text Area Entry window.

**Deleting columns** Follow these steps to delete columns:

- 1 In the Columns list, click the column you want to delete.
- 2 Click Delete.
- 3 Click Ok. You return to the Text Area Entry window.

## CREATING A BULLETED LIST

To create a bulleted list, follow these steps:

- 1 Place the cursor where you want the bulleted list to begin, then choose the Format, Bullets and Numbering option. The Bullets and Numbering window appears.

- 2 Select the type of bullet you want. You can choose from these bullet options:

To use a

Choose

|                                            |               |
|--------------------------------------------|---------------|
| Specific character in a font as the bullet | Font bullet   |
| Symbol character as the bullet             | Symbol bullet |
| Bitmap logo as the bullet                  | Logo          |

If you chose a symbol or font bullet, make the appropriate selection in the Character or Font field, respectively. If you chose logo, click the Logo button to specify the logo you want to use.

- 3 Click Color to select the color you want.

- 4 Use the Align field to specify how you want the bullet positioned along the left margin.
- 5 Use the Indent field to specify how much the system should indent the bullet from the left margin.
- 6 In the Text Indent field, specify the distance between the bullet and the text. Your entry here must exceed your entry in the Indent field. When finished, click Ok.
- 7 Type the text you want for the first item in the list and press **ENTER**. Continue until you complete the list.

**NOTE** To end the bulleted list, choose the Format, Bullets and Numbering option, then select None in the Type field and click Ok.

## CREATING A NUMBERED LIST

To create a numbered list, follow these steps:

- 1 Place the cursor where you want the numbered list to begin, then choose the Format, Bullets and Numbering option. The Bullets and Numbering window appears.

- 2 In the Type field, choose the Number option. Then choose the font you want in the Font field.
- 3 In the Style field, select the numbering style. You can choose from these options:
  - 1, 2, 3
  - A, B, C
  - I, II, III
  - a, b, c
  - i, ii, iii
- 4 Click Color to select the color you want.

- 5 In the Format field, you can specify a character to precede the number and a character to follow the number (or letter if you chose that style). For instance, to use a style such as

A.1.  
A.2.

you would enter:

Format: A. 1 . Underline  
A.1. Start at: 1

[Click here to underline the numbers](#)

- 6 Use the Align field to specify how you want the number positioned along the left margin. This field is typically used when you are using Roman numerals. For instance, this demonstrates left alignment:

I. Text...  
II. Text...  
III. Text...

If you right align the same paragraphs, this would be the result:

I. Text...  
II. Text...  
III. Text...

- 7 Use the Indent field to specify how much the system should indent the number from the left margin.
- 8 In the Text Indent field, specify the distance between the number and the character that follows it, if applicable, and the text. Your entry here must exceed your entry in the Indent field. When finished, click Ok.
- 9 Type the text you want for the first item in the list and press ENTER. Continue until you complete the numbered list.

---

**NOTE** To end the numbered list, choose the Format, Bullets and Numbering option, then select None in the Type field and click Ok.

---

## ADDING COLOR TO TEXT

Color lets you add color to selected text. Use a variety of colors to highlight specific words and important information within the text. Color can also be used to segment areas of text.

From the Color window you choose from 16 default palette colors or you create your own color. You can create up to 48 additional colors and add them to the palette. You can remove and replace colors you create. The 16 original colors cannot be removed or replaced.

To color text, follow these steps:

- 1 Highlight the block of text you want to color; then, choose Edit, Color. The Color Selection window appears:

- 2 To change a color, click the Default field to remove the check mark. This activates the list of available colors and the Custom button.
- 3 Select a color from the list and click Ok. Or, to choose a custom color, click Custom. The Color window appears.

- 4 If you want a color that is not displayed, click an undefined custom color (usually black); then, click Define Custom Colors. The window extends to a palette where you can create any color you want.

- 5 Use your mouse to select the custom color from the color palette and to adjust the slide bar until you achieve your color mix; or, enter the numbers that define the color in the Hue, Sat, Lum, Red, Green, and Blue fields.
- 6 Double click the solid color to change the split field to a solid color; then, click Add To Custom Colors. Your custom color appears in the custom color box you highlighted earlier.
- 7 Click Ok. You return to the Color Selection window.
- 8 Your custom color appears in the sample color field. Click Ok. You return to the Text Editor Entry window.

---

**NOTE** If you make a color selection with no text highlighted, the next text you enter appears in the selected color. If you have a color printer, you can click the Print in Color field in the Color Selection window. Contact your system supervisor or check the Documaker Workstation Supervisor Guide for the correct INI setting.

---

### Removing a Custom Color

To remove a custom color you defined, click the color to select it; then, click Remove.

## CHECKING YOUR ENTRIES

Use the Tools, Spell Check option to check spelling. The Spell Check option offers the ability to add words to the user dictionary which you can apply to any multi-line text area within any image. If you find terms or phrases you want to change, you can use the Tools, Find/Replace option to quickly search and replace text.

## CHECKING SPELLING

To check spelling, choose Tools, Spell Check. If the system finds a misspelled word, the Check Spelling window appears:

To correct the spelling of a word, select the correct spelling from the Suggestions field or click in the Replacement field and type in your own spelling. Then click Replace. You have these other options:

| To...                                           | Select...              |
|-------------------------------------------------|------------------------|
| Skip this word and continue                     | Ignore                 |
| Skip every occurrence of this word              | Ignore All             |
| Replace this occurrence of the misspelled word  | Replace                |
| Replace every occurrence of the misspelled word | Replace All            |
| Add this word to your custom user dictionary    | Add To User Dictionary |
| Edit your custom user dictionary                | Edit User Dictionary   |
| Set spell check options                         | Options                |
| Return to the Text Editor window                | Cancel                 |

## Setting Spell Check Options

From the Check Spelling window, click Options. The Spelling Options window appears. Click any or all of the following:

| To...                                                                                                                      | Select...                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select the language.                                                                                                       | Your language in the Language field. The system includes dictionaries for several languages including U.S. English, U.K. English, French, German, Italian, Spanish, Dutch, Finnish, Swedish, Brazilian Portuguese, European Portuguese, Norwegian, and Danish. |
| Skip capitalized words during spell checks.                                                                                | Ignore Capitalized Words                                                                                                                                                                                                                                       |
| Skip words containing numbers during spell checks. For example, the word "Sea2Land" is skipped when this option is active. | Ignore Words with Numbers                                                                                                                                                                                                                                      |
| Skip words with both upper- and lowercase during spell checks.                                                             | Ignore Words with Mixed Case                                                                                                                                                                                                                                   |
| Locate words with both upper- and lowercase letters during spell checks.                                                   | Report Words with Mixed Case                                                                                                                                                                                                                                   |
| Check letters on both sides of an apostrophe as single words during spell checks.                                          | Treat Apostrophe as Word Separator                                                                                                                                                                                                                             |
| Check letters on both sides of a hyphen as separate words during spell checks.                                             | Treat Hyphen as Word Separator                                                                                                                                                                                                                                 |
| Check for improper capitalization.                                                                                         | Case Sensitive                                                                                                                                                                                                                                                 |
| Check spelling of compound words.                                                                                          | Accept Compound Words                                                                                                                                                                                                                                          |
| Suggest splitting compound words.                                                                                          | Suggest Splitting Compound Words                                                                                                                                                                                                                               |
| Make suggestions based on how the misspelled word sounds when spoken.                                                      | Phonetic Suggestions                                                                                                                                                                                                                                           |
| Make suggestions based on how the word is typed.                                                                           | Typographical Suggestions                                                                                                                                                                                                                                      |
| Receive suggestions for each misspelled word during spell checks.                                                          | Always Suggest                                                                                                                                                                                                                                                 |

## Editing Your User Dictionary

From the Check Spelling window, click Edit User Dictionary. The Lexicon window appears.

You have these options:

To...

Click...

Add a word to your dictionary, type the word in the New Word field and Add

Delete a word from your dictionary, click the word in the Lexicon field Delete and

Remove all words from the dictionary Clear

Warning: Use this selection with care. If you select Clear, you delete *all* words in your user dictionary.

Exit the Lexicon window Close

## USING THE GRAMMAR CHECKER

When entering or editing text using the Text Editor, you can use the Tools, Grammar Check option to check for common grammatical errors.

**NOTE** Because of the complexity of the English language, no grammar checker can find every possible problem or even agree on what is or is not a problem. This tool can help you spot potential errors, but you should always carefully review the text you add to your forms.

The Grammar Check option only applies to U.S. English.

To customize what types of errors the system looks for, select Tools, Grammar Options. You can use this window to specify the types of problems you want the Grammar Check option to look for:

| Usage                  | Description                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax errors          | Errors in the combination of words that may be caused by missing or extra words, use of the wrong word, or words out of sequence.                                                                                                       |
| Misused words          | Problems where a word has been used incorrectly, probably because it has been confused with another word. This includes words such as <i>hoars</i> and <i>you're</i> ; <i>it's</i> and <i>its</i> ; and <i>there</i> and <i>their</i> . |
| Number agreement       | Conflicts between the number of items and the modifiers which refer to them, such as <i>a these apple</i> or <i>a dogs</i>                                                                                                              |
| Subject-verb agreement | Conflicts between the number (plurality) of a subject and the verb which it acts on, such as <i>the employees wants longer lunch breaks</i>                                                                                             |
| Verb tense             | Conflicts with the tense of a verb and surrounding auxiliary verbs, such as <i>I have get my raincoat</i> This category also includes mixed verb tenses.                                                                                |

| Usage                  | Description                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Possessives            | Potentially incorrect use of a possessive form, such as <del>girls's</del> instead of <i>girls'</i> , or incorrectly using a possessive form in place of a plural.       |
| Capitalization         | Failure to capitalize certain words or failure to capitalize the first word of a sentence.                                                                               |
| Abbreviation form      | Missing or unnecessary punctuation in abbreviations.                                                                                                                     |
| Number form            | Problems with the form or style of numbers, such as spelling out large numbers or using numerals for small numbers.                                                      |
| Unbalanced punctuation | Finds missing punctuation, such as <del>“</del> without a corresponding <del>”</del> .                                                                                   |
| Classified singulars   | Phrases that turn a single object into a class of objects, such as <del>this</del> <i>kind of a car is the one I'm looking for</i>                                       |
| Qualified absolutes    | Absolute adjectives and adverbs that are modified with comparative or superlative adverbs, such as <del>a</del> <i>more perfect</i> or <i>very unique</i>                |
| Double comparisons     | Comparative and superlative adjectives and adverbs that are modified with comparative adverbs, such as <del>more</del> <i>quicker</i> and <del>most</del> <i>fastest</i> |
| Double negatives       | Negative adjectives joined with a negative modifier, such as <del>not</del> <i>uncommon</i> , which can be expressed more clearly in a positive form.                    |
| Wordy phrases          | Phrases containing superfluous words that can be rewritten more concisely, such as <del>in a</del> <i>large number of cases</i>                                          |
| Redundant phrases      | Where the meaning of one word implies the meaning of another word, such as <del>connect together</del> or <del>repeat again</del>                                        |
| Archaic words          | Words that are no longer in common use, such as <del>betwixt</del> and <i>perchance</i>                                                                                  |
| Stilted words          | Long, overblown words and phrases that can be expressed in simpler terms for clarity.                                                                                    |
| Awkward usage          | Words and phrases that are too informal or do not read well, such as <i>ain't</i> and <i>that there</i> .                                                                |
| Vague modifiers        | Use of adjectives and adverbs that convey little meaning, such as <del>rise</del> and <i>very</i> .                                                                      |
| Jargon                 | Words with a technical meaning applied in non-technical writing.                                                                                                         |
| Cliches                | Overworked phrases that can be rewritten to avoid triteness.                                                                                                             |
| Gender-specific terms  | Terms which some consider sexist, such as <del>chairman</del> or <i>waitress</i>                                                                                         |
| Confusing terms        | Terms which may confuse the reader because several possible interpretations exists or because the word's form suggests an alternate meaning.                             |

| Usage                      | Description                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Commonly confused words    | Words people often mistakenly use in place of correct words, usually because the words look or sound similar, such as <i>accept</i> and <i>except</i> , <i>allusion</i> and <i>illusion</i> .                    |
| Contractions               | Contracted words such as <i>can't</i> and <i>should've</i> that should be expanded in formal writing.                                                                                                            |
| Punctuation inside quotes  | Terminal punctuation placed inside quotation marks. <i>"This is the end," she said</i> is the preferred form in North America. The system will report instances of punctuation inside quotation marks.           |
| Punctuation outside quotes | Terminal punctuation placed outside quotation marks. <i>"This is the end", she said</i> is generally considered incorrect in North America. The system reports instances of punctuation outside quotation marks. |
| Unusual word combinations  | A pattern of words that seems unusual and may indicate a problem such as a missing, extra, or out of sequence word.                                                                                              |

If the system finds an error, it presents suggestions in the Grammar Check window:

You can choose to ignore this suggestion, ignore all similar suggestions, or make the change. You can also go to the Grammar Options window or cancel the grammar check.

## USING THE FIND/ REPLACE OPTION

Find/Replace lets you locate specific words, phrases, or character strings within the text area and quickly replace them if necessary.

To find text, choose Tools, Find/Replace. The Find/Replace window appears:

- 1 Type the word or phrase you want to find in the Find field.
- 2 If you want to replace text you searched for with new text, enter the new text in the Replace With field.
- 3 Click either or both of the following Search Criteria options.

To locate search items...

Select...

|                                                           |
|-----------------------------------------------------------|
| Only when they appear as complete words. Whole Word Only  |
| Regardless of upper and lower case lettering. Ignore Case |

- 4 Click one of the following Scope options:

To find search items...

Select...

|                                        |                  |
|----------------------------------------|------------------|
| Anywhere in the text area.             | Entire Text Area |
| Only from the cursor position forward. | From Cursor      |

- 5 Click Ok to begin the search. The system highlights the first appearance of your search word or phrase. Follow the prompts to replace text and continue the search.

## USINGHELP

From the Help menu, you can choose from Contents, How To, Shortcuts, Glossary, Using Help, or Product Information. You can also display Help while working in the system by pressing **F1** or clicking the Help buttons that appear on windows.

See [Help menu options on page 68](#) for more information about the Help options.
